ii  
of Fever

The History of Fever maybe seen  
at large in Vanswieten's Comment:  
on Boerhaave's Aph: § 749. 750. 751.

W: Phenomena ac Chauteris:  
- the of a Fever? — The Ancients sup-  
- posed, <sup>Heat,</sup> but this Doctrine is now de-  
- sected. Boerhaave makes it to  
consist in the Frequency of  $\frac{2}{4}$  pulse,  
altho this is liable to a few excep-  
- tions yet it deserves generally to  
be admitted. I am apt to think the  
Pathognomic Symptoms of a Fever  
consist rather in a concurrence of  
Symptoms than in the Heat or pulse

100

## of Fevers.

alone. a Cold Pitt always breeds  
a Fever, and as the Heat itself and  
Frequency of pulse depend upon this,  
I think we ought to take in Cold as  
one of the most distinguishing Charac-  
-teristics of a Fever. — This Cold is  
produced by a Spasm of the Intermittens  
of the Arteries.

This Cold is not founded on any  
viscidty of the Liquidum Arteriarum  
nor on any other Affection of the Solids  
as Vanswieten supposes V 55. But de-  
-pends entirely upon a weak Influx of  
the Nervous Fluid from y<sup>e</sup> Sensor: Commu:  
into the Organs of Sense, Motion, and

*[The handwriting in this block is extremely faint and illegible.]*

5

## of Fevers

those performing the vital & natural  
Functions. the Lapsitude - weakness &  
the <sup>the</sup> Fevers begin plainly show <sup>the</sup> weaker  
Influx into the Organs of motion. the  
great Insensibility of the patient - <sup>the</sup>  
weak and small pulse - <sup>the</sup> Debility of the  
Heart - as also the Dyspnoea, & Anxiety  
indicate that the Blood cannot be suf-  
ficiently evacuated, and that <sup>the</sup> vital  
parts are affected. Vomiting & other  
Circumstances show that the natural  
Functions are injured in <sup>the</sup> same way.  
all this taken together proves that  
there is an Inertia Liquidi Nervae or some

There is no doubt that the Government is  
all this time together for the purpose of  
convention and in the hope that  
Government will be able to do so.

7

of Fever

Cause preventing its Influx into <sup>2</sup> different Organs <sup>in</sup> sometimes goes as far as to terminate in a total Cessation of the nervous Power, <sup>so</sup> that no hot Pitt succeeds at all as we see in some Malignant Fevers, and we see that it is commonly in the cold Pitt of Intermittents that People die.

a Spasm on the Surface or Vessels of the vessels is a Step to form Fevers, and the very first Cause in such as arise from Cold. Thus a Spasm seems to form Fever, but can be produced too from external Cold. The Question now is, if Spasm is always <sup>2</sup> Foundation

The following is a list of the  
 names of the persons who  
 were present at the meeting  
 of the Board of Directors  
 of the Company, held on  
 the 1st day of January, 1850.  
 The names of the persons  
 who were present at the  
 meeting of the Board of  
 Directors, held on the 1st  
 day of January, 1850, are  
 as follows:

of Fever? — It can in a certain  
Degree bring on Debility, for from  
topical Affection without this, those  
Symptoms do very constantly appear.

Debility may be previous to & occasion  
Spasm. Thus passions of the mind as  
Fear may induce Debility, & this may  
occasion Spasm. many contagious  
produce first a Debility. But we must  
allow that tho' many contagious induce  
first Debility, they often cannot induce Fe-  
-ver unless a stronger occasion of  
Spasm is applied i.e. Cold or Fear.  
[Did: Lind on Fever and Infection] hence  
the Spasm may be looked upon as universal.

of Fevers.

How this Spasm may be the means of  
bringing on the hot Fitt we cannot  
consider now, and only will take it as  
a Fact. From w<sup>h</sup> has been said we see

(a) Why Contagion, Cold & Fear may  
be the Causes of Fevers, and why they are  
most commonly the Occasion of primary  
Fevers.

(b) Why Hamorrhagic tendency - inflam-  
-matory congestions - or increased Impe-  
-tus or Distention as in Rheumatism  
may be likewise Causes to Fevers, but  
always of such as are attended with  
topical Inflammation & therefore are  
Symptomatic, for the Overcoming of

of the

from this, it is not easy to see the  
 meaning of the text in context  
 and it is not clear what the author  
 is trying to say. The text is very  
 faint and difficult to read. It appears  
 to be a list of items, but the words  
 are too light to transcribe accurately.  
 The handwriting is cursive and the ink  
 is very faded. The paper is aged and  
 discolored. The text is written in  
 a single column and is centered on the  
 page. The overall appearance is that of  
 an old, handwritten manuscript.

## of Fevers

of Resistance or Distention always excites a Sense of Cold, as we perceive at times in making water, and as women in Labour always perceive during <sup>the</sup> time of their Delivery. —

Spasms then not only form, but supports the Fever, the nature of Fevers depending upon the Spasm <sup>or</sup> must be known by its causes. —

## of the Distinctions of Fevers.

The universal Fevers have been distinguished into the Continents — Remittents — and Intermittents.

Continents are supposed to exist not only for longer than 24 hours, but

*[Faint, illegible handwriting visible through the paper.]*

## of Fevers

even for many days without any Exacerbation or Remission. But I doubt greatly of the Existence of such Fevers

1<sup>st</sup> Because I have seen 1000 Fevers, and yet I never saw any such continual Fevers, but always had either an Exacerbation or Remission, and more commonly both in 24 hours. Dr. Haen likewise, and several other late writers will not allow any such Fevers

2<sup>nd</sup> If there is an Inflammation, Exacerbations & Remissions distinctly are to be observed.

3<sup>rd</sup> in Acutes daily Revolutions, and consequently Exacerbations & Remissions

of course  
 over for many days without any  
 indication of a change in the  
 quantity of the secretion of the

## of Fevers

are to be observed.

4<sup>th</sup>: There is a daily Revolution in the human System w<sup>ch</sup> lays <sup>the</sup> Foundation of all periodical motions in the Animal Economy, & must necessarily influence Fevers.

5<sup>th</sup>: All Authors allow that Fevers run often in to one another. Continuals turn <sup>Re</sup> ~~Inter~~mittents - Remittents - Inter-mittents &c. now since two Types Remittents and Intermittents admit of Remission & Exacerbation it is evident that the more general & prevailing nature of Fevers inclines to Remissions & Exacerbations.

*[Faint, illegible handwriting throughout the page]*

of Fevers

The Continuals are to be rejected  
 therefore as never existing. there then  
 remain only two Genera viz Remittents  
 & Intermitents. every Fever in a  
 continual Form belongs really to the  
<sup>Re</sup>  
~~Inter~~mittents.

It has frequently been a Question how  
 far Remittents could be treated like  
 Intermitents. I am afraid the Law  
 in <sup>the</sup> Bark would be safe occur too  
 seldom in this Country. we may  
 however give it w<sup>th</sup> the utmost Safety in  
 all Cases where the Paroxysms are  
 more distinctly marked, & preceded by a  
 kind of cold Fit. —

The Committee on the subject of the  
 proposed amendment to the  
 Constitution of the State, have  
 the honor to acknowledge the receipt  
 of your communication of the 10th  
 inst. and in reply to inform you  
 that the same has been referred  
 to the Committee on the subject  
 of the proposed amendment to the  
 Constitution of the State, and  
 that they are now engaged in  
 a careful consideration of the  
 same.

## of Fevers.

But there are other Characteristics  
to distinguish Fevers preferably to Re-  
missions, and <sup>it</sup> is of equally great  
use for the prognostics, & treatment to  
know.

The Spasm <sup>it</sup> occurs in all Fevers, and in  
which the Disease properly consists, has a  
Share in promoting Symptoms of Debility  
on one hand, and in producing an en-  
-creased Action of the vital powers on the  
Other. Hence there may be made a principal  
Distinction between Fevers viz: such as  
where Debility, and such where increased  
Action of the vessels prevail. —

It is therefore from the Symptoms of  
Debility and Spasm <sup>it</sup> we may form a

The first of these is the fact that the  
 system is not a simple one, but a  
 complex one, involving many different  
 factors, and the second is the fact  
 that the system is not a static one,  
 but a dynamic one, which is constantly  
 changing and evolving. The third  
 fact is that the system is not a  
 closed one, but an open one, which  
 is constantly interacting with the  
 environment. The fourth fact is  
 that the system is not a linear one,  
 but a non-linear one, which is  
 characterized by the presence of  
 feedback loops and other non-linear  
 relationships. The fifth fact is that  
 the system is not a deterministic one,  
 but a probabilistic one, which is  
 characterized by the presence of  
 uncertainty and risk. The sixth fact  
 is that the system is not a single-  
 entity one, but a multi-entity one,  
 which is characterized by the presence  
 of multiple stakeholders and interests.  
 The seventh fact is that the system  
 is not a static one, but a dynamic  
 one, which is constantly changing and  
 evolving. The eighth fact is that the  
 system is not a closed one, but an  
 open one, which is constantly interacting  
 with the environment. The ninth fact  
 is that the system is not a linear one,  
 but a non-linear one, which is  
 characterized by the presence of  
 feedback loops and other non-linear  
 relationships. The tenth fact is that  
 the system is not a deterministic one,  
 but a probabilistic one, which is  
 characterized by the presence of  
 uncertainty and risk.

## of Fevers

Prognostic concerning the Resolution &  
 Duration of the hot Fit, and determine  
 the difference between the Genera, and  
 even Species of <sup>Fevers</sup> ~~Diseases~~ especially Intermitt-  
 -ents. For the more remarkable the cold  
 Rigor be are, the less difficult will be <sup>the</sup> ~~the~~  
 Solution of the hot Fit, - the sooner will  
 the Intermission come on, & the longer &  
 more remarkable will be the Intervals. This  
 is the Case in Intermittents whose different  
 Species may be determined by this prog-  
 -nostis. on the other hand the less remar-  
 -kable & distinct the Symptoms of Fevers are  
 the longer the hot fit will last, and the  
 more frequently <sup>the</sup> Paroxysm will be  
 repeated as appear in Remittents. -

*[Faint, illegible handwriting on the adjacent page, partially visible.]*

## of Fevers

The Distinction of Fevers as mentioned  
by Sauvage & others into Synocha & Ph-  
-meras &c according to <sup>n</sup> Duration is  
very ill founded, and is it very doubtful  
if Duration gives any Character for  
distinguishing Fevers. There may be Ph-  
-meras the same Duration in Fevers of  
quite Opposite and different natures. &  
Fevers of one kind are often of a very  
different Duration. hence the Epidemics  
are more distinguished by their Duration  
as well as their Symptoms, yet Duration  
is not so universally constant, as to  
apply it in a Nosologia. The Only  
Distinction founded on constant and

27

Of Fevers.

universal Characters is according to 4:  
different tendency of the Spasms as pro-  
-ducing either more Debility, or more en-  
-creased Action of the Heart. This now in  
England is the common Distinction be-  
-tween Nervous & Inflammatory Fevers.  
This we grant Applies clearly and to ma-  
-ny Cases, yet it is not sufficiently uni-  
-versal. a Fever may have all the Ap-  
-pearances of an Inflammatory in its  
first seven days, but in its 2<sup>nd</sup> and still  
more in its 3<sup>rd</sup> it may put on all those of  
a Nervous Fever.

In Nervous Fevers there may again  
be made Subdivisions according to their

The above mentioned person has been  
admitted to the office of the  
Recorder of Deeds for the County of  
Harrisburg, Pennsylvania, and will  
be ready to receive applications for  
recording at his office at the  
Court House, Harrisburg, Pa., on  
Monday next, the 1st day of  
January, 1867.

I am, Sir,  
Very respectfully,  
Your obedient servant,

remote Causes, as these may be Contagion Cold &c. thus when <sup>L. & Inertia</sup> has been produced by Contagion (w<sup>ch</sup> equally may happen in Inflamm<sup>n</sup>: as well as nervous Fevers) the Fever is in its nature a putrid One. putrid Fevers however do not always depend upon Contagion. they may arise from Debility itself, and we find putrid Fevers in cold Climates & Seasons where there is not the least Suspicion of putrid Contagion.

## Prognostics in Fevers

a Disease is supposed to be a Certamen between the Disease and Nature. we

The first of these is the fact that the  
 population of the country is increasing  
 rapidly, and that the number of  
 persons who are engaged in  
 agriculture is also increasing.  
 This is due to the fact that the  
 land is fertile and the climate is  
 favorable for the growth of  
 crops. The second fact is that  
 the people are becoming more  
 civilized and are adopting the  
 customs and habits of the  
 more advanced nations. This is  
 due to the fact that the people  
 are in contact with the  
 more advanced nations and are  
 adopting their customs and habits.  
 The third fact is that the people  
 are becoming more educated and  
 are adopting the sciences and  
 arts of the more advanced nations.  
 This is due to the fact that the  
 people are in contact with the  
 more advanced nations and are  
 adopting their sciences and arts.  
 The fourth fact is that the people  
 are becoming more industrious and  
 are adopting the methods of the  
 more advanced nations. This is  
 due to the fact that the people  
 are in contact with the more  
 advanced nations and are adopting  
 their methods of industry.

## of Fevers

have considered two distinct States in  
 Fevers Inertia & Spasm, & then enu-  
 merated Action of the vital powers. we have  
 shown that this latter may be looked  
 upon <sup>as</sup> an Effort, or Conatus of this vis  
 nature medicatrix to remove <sup>& former</sup>  
 now according to the different Point of the  
 Certamen between the Disease and  
 Nature (to use the metaphor) as either  
 Disease or Nature subdues its Adversary,  
 we shall consider the Causes of Death as  
 well as Recovery.

### Causes of Death.

Life depends (a) on a mobility of the  
 Nervous power i.e. on its Fitness to be

## of Fever

moved from the Origin of the nerves to  
 the different parts of the Body, and from  
 thence again to the Origin of the nerves  
 (b) on the regular Distribution of  
 this power to the different parts. hence  
 we have two kinds of Causes of Death  
 1<sup>st</sup> Such as destroy the mobility of the  
 nervous power 2<sup>nd</sup> Such as interrupt  
 its regular Distribution by affecting  
 the Organs necessary to it. the latter  
 are less obscure, and more easily un-  
 derstood than the former. to the first  
 head belong all those Causes of Death  
 which kill without any Alteration in the Or-  
 gans, at least as far as we can perceive

18th Nov 1849

I have just received from the  
Hon. Secy of the Navy a copy of  
the report of the Committee of Enquiry  
into the state of the Navy, &c.  
which I have just perused. It is  
a very interesting & important  
document, & I have no doubt  
that it will be of great service  
to the Government in their  
efforts to improve the Navy.  
I have also received from the  
Hon. Secy of the Navy a copy of  
the report of the Committee of Enquiry  
into the state of the Army, &c.  
which I have just perused. It is  
a very interesting & important  
document, & I have no doubt  
that it will be of great service  
to the Government in their  
efforts to improve the Army.

## Of Fevers.

by our Senses such as Lightning, Electricity  
 - mephitic Air - Joy Fear - and several  
 poisons w<sup>h</sup> prove suddenly mortal. it  
 is very difficult to explain how these  
 operate. we see that Opium by acting  
 on a single part destroys its Sensibility &  
 Irritability, hence we may conclude y<sup>t</sup>  
 Opium acting in sufficient Quantity  
 on the whole System operates by destroy-  
 ing the mobility of the nervous power, to

the 2<sup>nd</sup> Head belong such things as injure  
 the vital Organs, as the Brain, Lungs &c.

There may then be several Causes  
 of Fever when in a high Degree produ-  
 -cing Inertia & Debility w<sup>h</sup> likewise  
 produce Death by destroying y<sup>e</sup> mobility

## of Fevers

of the nervous power without any evident  
alteration on the Organs. Thus we  
see that those who die of a Fever die  
commonly in the cold Pitt or in a time  
analogous to it. Hence Boerhaave &  
Others have been wrong in supposing  
Death always owing to the excess of  $\frac{2}{4}$  hot  
Pitt, and have entirely overlooked this  
first head. —

## Causes of Recovery.

With respect to this there are two  
Opinions 1. the Hypothesis of  $\frac{2}{4}$  Amicats  
and which the following Author very  
universally copied was that in every  
Fever there is a morbid matter which

## of Fevers

must be changed in its nature & assimilated, or thrown out of the body <sup>in</sup> w: they call Concoction & Excretion. —

Considering both these Hypotheses we must remark the following points. —

(1) Fever may arise from Cold & Congestion, Inflamm<sup>y</sup>, or Hemorrhagic alone without any morbid matter at all.

(2) even in contagious Fevers a Spasm is evidently produced to overcome which the Efforts of Nature principally tend whatever morbid matter there may be thrown Out.

(3) Where there is a morbid matter to

## Of Fevers

be known but there is no Evidence of  
Concoction &c. in the small pox the  
Matter is no more changed than in any  
Other Suppuration as from a Thorn in the  
Foot &c.

(d) whatever this Concoction may be  
we have it not in our power to promote  
or manage it or to correct <sup>the</sup> morbid  
Matter. &c. in Danger from Opium we  
only have it in our power to Obviate its  
Effects. in the Hydrophobia likewise  
no Body will think of correcting <sup>the</sup> morbid  
Matter or of promoting its Concoction.

(e) Whenever the Doctrine of Concoction  
is maintained, it is plain <sup>that</sup> this requires

1844

I have been thinking of writing to you for some time but have been so busy that I could not find time. I am now at home and have some time to spare. I am well and hope this finds you the same. I have been thinking of writing to you for some time but have been so busy that I could not find time. I am now at home and have some time to spare. I am well and hope this finds you the same. I have been thinking of writing to you for some time but have been so busy that I could not find time. I am now at home and have some time to spare. I am well and hope this finds you the same.

## of Fevers

a certain Duration <sup>is</sup> some have deter-  
mined by the Analogy of fermenting Li-  
quors - The Maturation of Fruits &c.

but this Doctrine is quite confuted by an  
Artificial Cure whereby safely & totally  
a Fever is removed without giving the  
supposed morbid matter any time for being  
concocted.

Thus we have no Reason to admit  
any morbid matter, or at least we cannot  
pay any Attention to it in <sup>the</sup> <sup>2</sup>managem<sup>t</sup>.

The Prognosis in Fevers may be deter-  
mined either 1<sup>st</sup> from Circumstances ante-  
cedent to the Fever viz its Causes, or 2<sup>nd</sup>  
from the Circumstances combined and

He

## Of Fever

impossible to ascertain. we only know  
 that Contagion arises from putrefaction,  
 and hence it appears that there must pro-  
 -bably be a difference according to <sup>the</sup> putrid  
 matter being Animal or Vegetable, being  
 accumulated in more or less Quantity,  
 being either confined by Cold - diffused by  
 winds - or excited by heat &c. we only here  
 observe that the putrid Inhalations of  
 marshy Grounds &c produce such a Con-  
 -tagion tho we cannot ascertain whether  
 it depends more on Exhalation than Putre-  
 -faction. however the surface of water  
 gives no such Contagion, as this is never  
 found on the ~~Sea~~ Sea Shores, nor in such

Grounds as are quite covered w: <sup>the</sup> water. at  
least the Diseases there are not of so bad a  
Tendency as where the water is not suff:  
to cover the ~~the~~ putrefying Litter of the  
Earth. Another modification of putrefac-  
tion which seems to bring on Contagion  
is a Collection of Effluvia stagnating  
in a place as in Sails or Hospitals from  
whence the most malignant Fevers arise.  
yet it is not to be determined if this air:  
not only consists in a mephitic Air  
at least confined w: <sup>the</sup> Putrefaction. from  
w: we are able to know of <sup>2</sup> several  
modifications of Contagion we may judge  
w: Tendency they will have, & where <sup>we</sup> they

53

of Fever

the Body it affects. generally it operates more considerably when it attacks suddenly than when by Degrees. a Body exposed to the now Degree of Cold in a River would be less diseased than one who was suddenly plunged in the water. tho' perhaps the concurrence of Fear here would be a great deal. the Cold generally affects more considerably in the <sup>winter</sup> ~~summer~~ season, than in <sup>a</sup> warmer ones ceteris: bus paribus. whatever Relation there may be between the Cold of the Body and Absolute Cold. - a transitory Cold will not have as considerable Effects on the Body as long continued Cold. Cold

The object of this report is to present a summary of the results of the investigation conducted by the Department of the Interior, in relation to the proposed extension of the boundary of the National Park, from its present limits, to the south-west corner of the section of land, containing the site of the proposed extension.

The w. Moisture affects more evidently  
than cold dry air. perhaps  $\frac{2}{3}$  moisture  
absorbed, and again exhaled adds to  $\frac{2}{3}$   
Cold of the Atmosphere.

(c) Fear - This operates most suddenly  
and strongly when sudden than when  
gradual. to Fear it may be owing  $\frac{1}{2}$   
when an Epidemic comes on in a City  
a greater number die in  $\frac{2}{3}$  first Begin-  
ning than when they are habituated  
to it. hence we see too the reason why  
the nearer People are related to any  
Body  $\frac{1}{2}$  dies, the more liable they are  
to be seized w<sup>th</sup> the same Disease. Fear  
affects more or less considerably

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting visible on the edge of the adjacent page.]*

## of Fevers

According to the Degree of Sensibility<sup>2</sup>:  
Body affected is hoped off.

(d) The State of the Body. may be reduced  
only to two heads.

1<sup>st</sup> Debility. This disposes considerably to  
the Operation of Contagion, Cold, and  
Fear. Thus Persons y<sup>th</sup> have undergone  
great Exercises of Body or Mind, great  
Vacuations, Watchfulness, Debauch, &c.  
are very liable to be Affected by the  
Other three Causes. hence it is y<sup>th</sup> putrid  
Fever occurs in cold seasons in our cold  
Countries without any ~~for~~ Suspicion of  
putrid Contagion from Putrefaction.

2<sup>nd</sup> Irritability. This is not to be explained.

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint handwriting visible on the adjacent page (58).]*

## of Fevers

nor can we tell the reason why young People - Sanguine Temperaments, and we may say generally Females are rather liable to be affected w<sup>th</sup> Fevers than Others. however here are many peculiarities to be observed. Robust people have a less Disposition to inflammation: Diseases, but suffer much greater Danger from those of a less Habit. young People have more frequent Fevers, but Melancholics have them worst. -

### Prognostics from

**II Symptoms.** These may be considered  
 1<sup>st</sup> as to their kind & Degree & 2<sup>nd</sup> as to their Course. we have no occasion

## of Fever

now to speak of the 3.<sup>rd</sup> viz Accidental  
Symptoms. —

1<sup>st</sup> then w<sup>th</sup> respect to the kind and de-  
-gree of febrile symptoms. it is a question  
w<sup>th</sup> manner of treating them would be  
most convenient. There are two ways  
1<sup>st</sup> to point out the various Symptoms  
in general that are mark<sup>d</sup> of either of  
the Above mentioned different tendencies  
in every Fever. 2<sup>d</sup> to consider them  
each in particular, and to point out  
to which of those tendencies it belongs.

I shall here only consider 4 Symptoms  
as relative to the different Functions of  
the vital, natural & animal. —

A Symptom of the vital Functions.

(2) of the Action of the Heart. This is evidently, and distinctly known by the pulse. hence the best mark of that is the Frequency of Pulse. This is owing either to increased Irritation, or imperfect Evacuation. This latter depends on a Resistance in the Lungs or elsewhere or on a Debility of the Heart itself. & Frequency of Pulse depending on any Resistance or Debility is of equally bad tendency. When owing to Irritation especially a Spasm it is less dangerous than when it likewise arises from Debility. every Frequency of Pulse arising from Debility is bad.

## Of Fevers

Dr Haller says  $y$ : a feverish pulse begins  
<sup>th</sup> w: 90, & ~~when~~ it exceeds 120 it is danger-  
 ous. But I have often seen it below 30  
 & in Fevers of a very bad kind, & frequently  
 above 120 without any Danger. in time  
 of Remission when the pulse continues at  
 or even exceeds 120, the Fever generally has  
 a fatal tendency, and when it comes to  
 140 & continues so it almost always  
 presages Death, unless it may be explained  
 by Age - sex &c. or when we perceive any  
 particular Cause of Determination to the head  
 or any Irritation of the Brain as in the Phre-  
 netic Delirium, patients may escape with  
 this Frequency of Pulse. — When we have

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the adjacent page, partially visible.]*

of Fevers

no Reason to suspect any nervous Debility or putrid malignity a pulse under 120 is generally safe, but fatal when those mentioned Circumstances are the causes of its Slowness.

When in a Remission  $\frac{1}{2}$  is not critical, & when we are to apprehend any Exacerbation the pulse is slow, it often deceives us, especially in the advanced State of a Disease. Thus I have seen a patient whose pulse from a considerable Frequency came down to 80 who was carried off in  $\frac{2}{3}$  next Exacerbation.

of The Smallness & Hardness of the Pulse. in this Practitioners seldom agree according to their Feeling - we can better distinguish a full and soft than a small & hard pulse. the small pulse universally indicates Debility & the hard

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the adjacent page, visible on the right edge.]*

## of Fever

One Irritation. both are bad. the small is always so. the full gives always Security. no Person dies (certain Cases excepted) w<sup>th</sup> a full pulse.

of The Equality & Regularity of the Pulsations. When these are Alternated it is always a Sign of Debility or of Irritation, and in both Cases very bad.

### (C) of Respiration.

(as its Frequency depends on 4 Causes as the Frequency of Pulse or of the Action of 4: Heart which requires a quick Respiration for the passage of the blood thro' the Lungs. it is in every Case a bad Symptom, & commonly fatal whereas a slow Respiration is universally a good Sign One single Case excepted viz a Coma. —

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting visible on the edge of the adjacent page.]*

## of Fever

(b) Laborious Respiration arises from Obstructions in the Lungs, or from considerable Debility, & has a most fatal tendency

(c) Full Respiration. This portends good provided it is without Labour.

(C) Heat & Cold may be referred to the vital Functions.

(a) Heat is always attended w: a <sup>th</sup> frequency of pulse. Cold sometimes, but not certainly. Increased Action of the Heart however is not always strictly connected w: <sup>th</sup> Heat.

(b) Cold in the Extremities in After stages of a Fever is very dangerous, & is a Sign of great Debility.

(B) Symptoms of the Natural Functions.

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

## of Fevers

The natural Functions do not concur actively in the *vires naturalis medicatrices*,  
 — The Ancients supposed a concoction & necessary which was the Effect of  $\frac{2}{4}$  natural Functions. but  $\frac{1}{4}$  doctrine we have rejected as we have no marks of  $\frac{1}{4}$  process in nature, but such as may be explained from  $\frac{2}{4}$  other Enquiry. the Lesions of the natural Function belong to

### 1. The Appetites.

1st, Hunger when impaired in its various Degrees viz want of Appetite. Loathing, nausea, & vomiting <sup>is</sup> always had according to the Degrees now mentioned. vomiting for  $\frac{2}{4}$  first days of a Fever is always had. it is probable the Appetite is always connected w<sup>th</sup>  $\frac{2}{4}$

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the adjacent page.]*

of Fevers

State of the Perspiration. hence want of sp.  
: petite is always a strong suspicion of a Spasm  
on the Skin.

(16) Thirst is either a Symptom of  $\frac{2}{4}$  cold & it  
marking a strong Constriction of  $\frac{2}{4}$  extreme  
vessels & hence bad, or of great increased Heat,  
or of Putrefaction <sup>in</sup> w: is always bad especially  
when Other Circumstances concur to confirm  
this Diathesis. it is said  $\frac{2}{4}$  Thirst arises from  
a Disipation of the thinner parts of  $\frac{2}{4}$  fluids  
in too large a proportion, but while Thirst  
prevails there is commonly a much greater  
Quantity of Fluids thrown in: tho there may  
be Cases where Thirst arises from  $\frac{2}{4}$  Cause as  
<sup>in</sup>  $\frac{2}{4}$  Dysentery's, Dropsies &c. —

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page. A dark, diagonal mark is visible near the center of the page.]*

*[Faint, illegible handwriting on the adjacent page, visible through the binding.]*

## of Fevers

(B) of the Excretions. These are Sputa, Fæces Alvine, Urine & Sweat. -

(a) Fæces Alvine. a regular belly and natural Stools show  $\frac{2}{4}$  mildness of Disease. But Constipation only yielding to medicines, & sometimes resisting them is a bad Sign, especially as this is commonly a Symptom of Determination to the head. When the Evacuation by Stools appears spontaneously, moderate in number - of due quality - not coilliquative or putrid it shows the Resolution of the Disease

(b) Urine. too much Dependence has been laid upon this by the Ancients. I shall only give you my own Observations w<sup>th</sup> regard to the Prognosticks from the Urine. —

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the adjacent page.]*

## of Fever

1<sup>o</sup> limpid pale coloured Urine when indur-  
 -pudent of a Quantity of Liquid thrown in  
 is always a Symptom of strong Phlegm, hence it  
 always attends the cold Fit of Fever. it is like-  
 wise a particular Symptom of Determination  
 to the head.

2<sup>o</sup> high coloured Urine especially when  
 having a Sediment is more favourable.

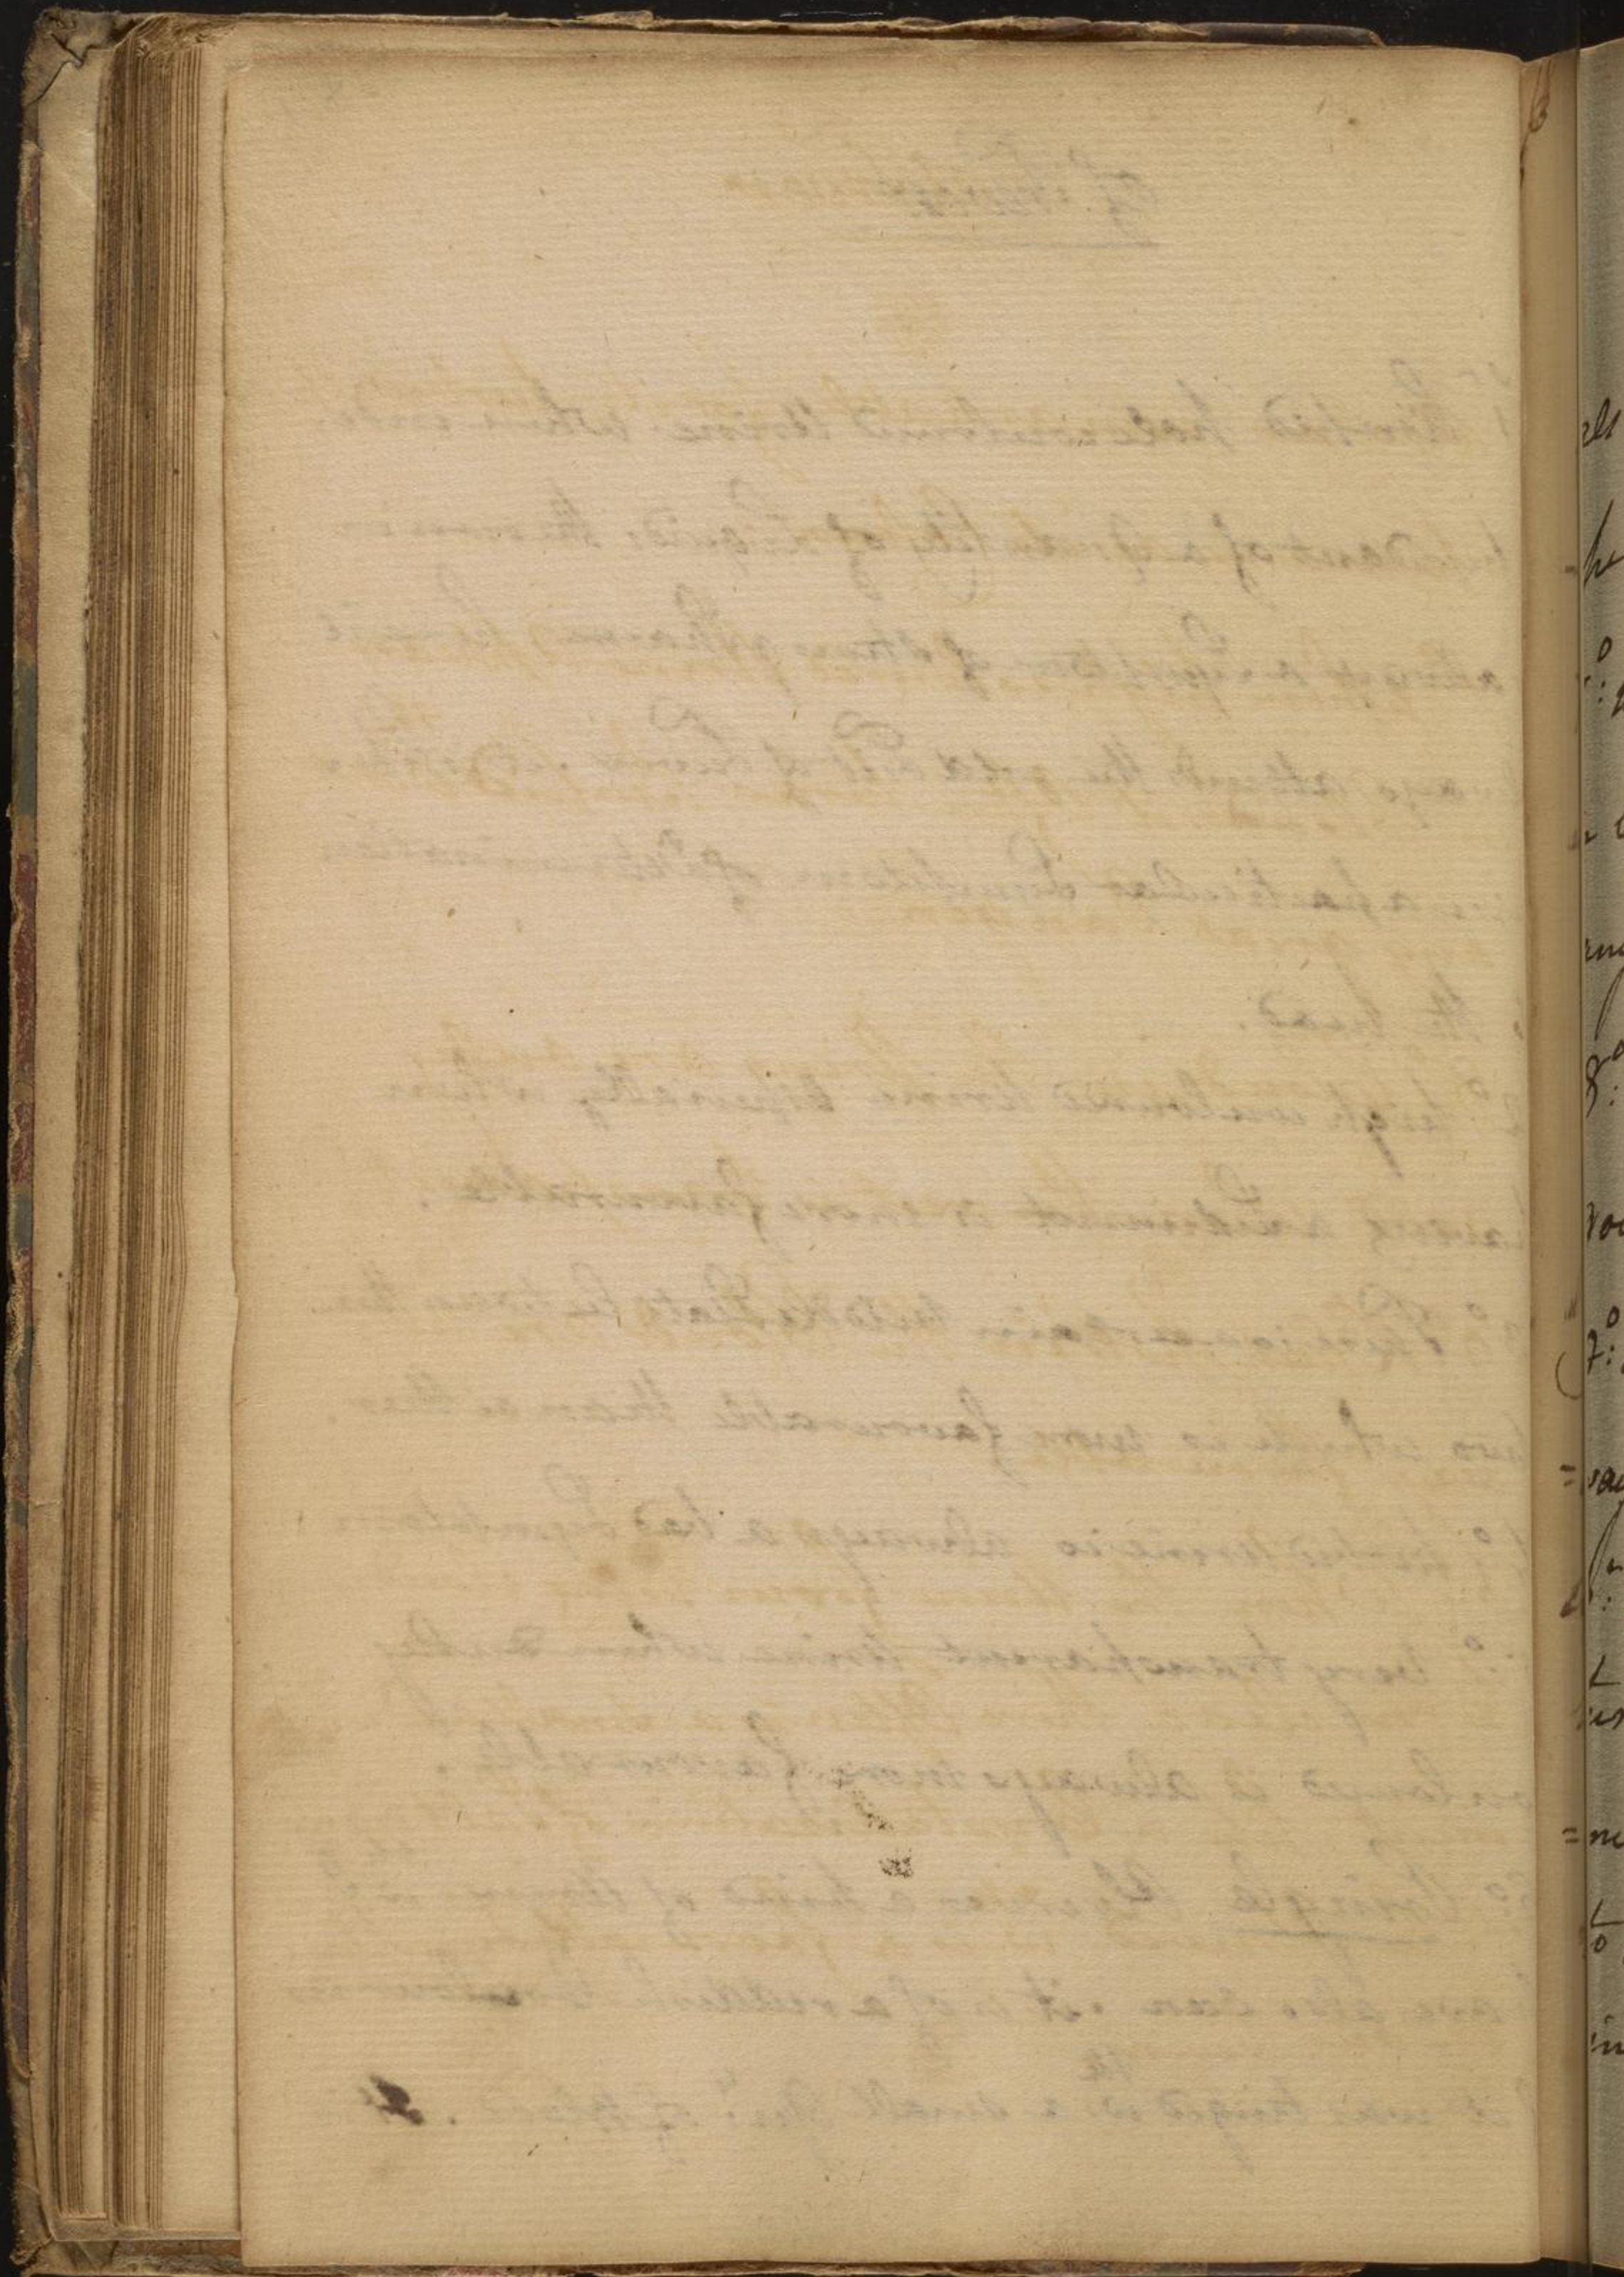

3<sup>o</sup> There is a certain middle State between these  
 two which is more favourable than either.

4<sup>o</sup> turbid Urine is always a bad Symptom.

5<sup>o</sup> very transparent Urine when duly  
 coloured is always more favourable.

6<sup>o</sup> Pringle observes a kind of Urine <sup>ch</sup> I  
 have also seen. it is of a reddish colour as  
 if it was tinged w<sup>th</sup> a small Qu<sup>ty</sup> of Blood. It is

also as remarkable for its turbid Ap-  
pearance as its colour.

7<sup>o</sup> When high coloured Urine Appears  
in Clouds, it often turns limpid <sup>the</sup> without  
any great Danger.

8<sup>o</sup> Clouds in the Urine are only  
good when the rest is transparent.

9<sup>o</sup> Black spots in the Clouds are al-  
ways favourable.

10<sup>o</sup> When the Urine from being cloudy  
turns clear, there often is a small sedi-  
ment, like a Crystallization of Salt seems  
to be Observed <sup>or</sup> is a favourable Symptom  
in our Fever. —

also in some cases the first of the  
 season as it is called  
 1. When the first of the season is called  
 in some cases it is called the first of the season  
 and in some cases it is called the first of the season  
 2. When the first of the season is called  
 in some cases it is called the first of the season  
 3. When the first of the season is called  
 in some cases it is called the first of the season  
 4. When the first of the season is called  
 in some cases it is called the first of the season  
 5. When the first of the season is called  
 in some cases it is called the first of the season  
 6. When the first of the season is called  
 in some cases it is called the first of the season  
 7. When the first of the season is called

 9. When the first of the season is called  
 in some cases it is called the first of the season  
 10. When the first of the season is called  
 in some cases it is called the first of the season

## of Fevers

### (c) Sweat

1<sup>o</sup> Universal moisture is always better than a dry skin as it marks less Phaen

2<sup>o</sup> Sweats that are partial & not extended over all the Body are bad. They are worse in <sup>the</sup> upper parts.

3<sup>o</sup> too profuse Sweats in <sup>the</sup> Beginning of a Fever are bad.

4<sup>o</sup> all cold clammy Sweats are bad

5<sup>o</sup> Sweats are only useful when the pulse becomes slower & fuller after them. if this sh<sup>d</sup> not be the case they should be interrupted.

(d) Hæmorrhages may be referred to this head. they are much rarer critical

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the adjacent page, visible on the right edge.]*

Of Fever

<sup>the</sup> w: us than they were <sup>the</sup> w: the Ancients.

They are only favourable in young  
 Plethoric patients, especially bleeding  
 from the nose. all others as Hemoptoes  
 bloody urine &c are bad. even the  
 menstura appearing in Fever at usual  
 or <sup>un-</sup>usual periods should always be checked,  
 as I have never seen any good Effects  
 from indulging their Flowing. The  
 Stillacidium is always bad, and may  
 be considered ~~as~~ on the same footing  
 as other Hemorrhages from putrefaction.

16 / Symptoms of the Animal Functions.

The Debility of motion is a Symptom of  
 the Formation of Fever. hence Fainting

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

85

## Of Fevers

upon an erect Posture, or lifting up the Head &c is a bad Symptom. a languid or dejected Countenance, or a Relaxation of the Muscles of the Face is a Symptom of Debility. the patients sliding down in the Bed always portends Danger.

### Symptoms of Sensation.

In considering different Objects we perceive a certain Relation between them, and in recalling certain Ideas we recall them in a certain train in y<sup>d</sup> Relation they had when they were impressed upon our Minds. Whenever our Ideas recalled or formed not do follow a certain due train we call them incoherent, & when they are not according to y<sup>d</sup> Relation we call

## of Fever

them inconsistent. of this Inconsistency  
 & Incoherence there are various Degrees.  
 The 1<sup>st</sup> Symptom of interrupted Locomotion  
 is when thinking is attended w<sup>th</sup> uneasi-  
 -ness. 2<sup>nd</sup> when in pursuing thinking we  
 find Stops and Gaps in y<sup>e</sup> natural and  
 ordinary train of the Ideas; when we meet  
 w<sup>th</sup> Oblivion. this we call Confusion of Head.

The other prognostics from y<sup>e</sup> natural  
 Functions may be seen in Proth: Alpinus.

(2) we should go to consider the Symptoms of  
 the Course of the Disease. the common Opinion  
 has been y<sup>t</sup> a Fever was naturally of a certain  
 determined Duration, w<sup>ch</sup> was necessary to  
 suppose for the concoction of y<sup>e</sup> morbid  
 matter & which they imagined to be peculiar

of Fever

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting visible on the edge of the adjacent page.]*

## of Fevers

regular movements - y<sup>h</sup> the Crises of the  
 Ancients are constantly true, and that tho'  
 they are not so observable here as they  
 were in Ancient Greece, yet there is a  
 general tendency to Regularity & Regu-  
 -larity in the Fevers of our Climates.

Our System both in Health & Disease  
 is disposed to periodical motions, as appears  
 from our easily assuming periodical  
 Habits. Our System is determined to the  
 Vicissitudes of Sleep & watching in which  
 we most easily accustom ourselves to  
 certain Habits. we are very ready to ac-  
 -quiesce for the necessity of Sleep from y<sup>h</sup> Change  
 of Circumstances &c. but the Force of

## Of Fevers

a peculiar Habit gets the better of all this. a weak man y<sup>e</sup> sh<sup>d</sup> therefore sleep 7 hours will awake at the accustomed time tho' he sh<sup>d</sup> have gone to bed an hour before. hence we are accustomed to certain diurnal Revolutions w<sup>ch</sup> may influence Fevers too. Epilepsy - Astmas - Hysteria & many other spasmodic Affections commonly attack periodically. these are nervous Diseases, and as the Fevers are commonly subject to periodical motions this serves still further to establish their being of a nervous nature. Intermittents are exact in their Periods. they easily change into Continuals, hence we must suppose y<sup>e</sup> w<sup>th</sup> the change they transfer their regular periodical

Movements. When there is a constant Stimulus in inflammatory & Exanthematic Fevers, they appear in the form of Remittents. See Dr Martin on Crises. —

The next Question is <sup>1</sup> Sort of periodical Motions occur in continued Fevers and how far they are constant? This is doubtful yet: the Objection is not confirmed to the moderns. even Aesclepiades mentions it, and Celsus repeats it after him. but I believe the matter has been carried too far by them both. <sup>2</sup> Ancients only plead for a general Tendency to Regularity. we all agree <sup>1</sup> <sup>2</sup> that actual Flux is periodical, tho' there is some Latitude in this, many Irregularities every where occurring, yet there is at least a universal

Tendency to a regular periodical Discharge.  
- Thus there is also in Leven a universal  
Tendency to regular periodical Movements.  
That these may have often been neglected  
or mistaken is plain, as also y<sup>n</sup> many Acci-  
- dents may disturb their Regularity. many  
Circumstances are Obscure, & escape the  
Notice of the most accurate Observers. Thus  
Frequently the first Attack passes unheeded,  
and when this is not marked our Reasoning  
is lost. - hence then there must be a  
Foundation for critical days since there  
is such a general tendency to them, we  
have then seen i<sup>n</sup> that of all Facts none  
support Truth more strongly y<sup>n</sup> that w<sup>ch</sup>  
is in the train of Nature whose Economy  
is disposed to periodical Movements.

*[Faint, illegible handwriting in cursive script, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the adjacent page, visible through the gutter.]*

2<sup>nd</sup>: That these Periods are founded on diurnal Revolutions. Thus in Tertians 3 of 4 will Attack at noon. Quartans regularly in the Afternoon from two to four O'Clock. Recties are Observed commonly at night, and midday to have a remarkable Exacerbation, & these are not properly connected w<sup>th</sup> meal time as is generally believed. I have seen them come on at 11 O'Clock in the Forenoon. Dr. Robertson has Observed y<sup>t</sup> the pulse is slow - not in the morning when People rise, it becomes quicker towards y<sup>e</sup> Afternoon - at 5 there is a Remission - in y<sup>e</sup> evening the Frequency is manifestly increased which continues till midnight when it

*[Faint, illegible handwriting in cursive script, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the adjacent page, visible on the right edge.]*

is quickest. Epileptic - podagric, & Asthmatic paroxysms generally Attack About two O'clock in the morning. we might imagin<sup>y</sup>: every Intermittent would turn continual, but a tertian only turns double because its principal Fit is not duly formed.

Every day of a Fever may terminate in Health or in Death, as they have a daily Revolution, & the Fever by changing its Fit may change its periodical movements.

— But the proper critical Days ~~of~~ are After the Aphorisms of Hippoc<sup>r</sup>: w<sup>h</sup> are considered as the most Authentick of his writings of the 3<sup>rd</sup>: 5<sup>th</sup>: 7<sup>th</sup>: 9<sup>th</sup>: 11<sup>th</sup>: 13<sup>th</sup>: 15<sup>th</sup>: 17<sup>th</sup>: 20<sup>th</sup>: &c. vid: Dr Martin. —

The State of Pyrexia however is still liable to mistakes and Doubts. The Arguments are so various &c that there may yet be many Exceptions Ag: general Rules.

The Followers of Hippocrates: not only took the Facts, <sup>but</sup> would also would make general Rules & condemned all even days. Hence Asclepiades objected to them. The 1<sup>st</sup>: they insisted upon a Quaternario, & than a Septenarium. Asclepiades asks why the first week consists of 7 days, the 2<sup>nd</sup> of 8<sup>th</sup> &c. the Reason they alledged in answer to this was, that the 2<sup>nd</sup> or last day was the Beginning of the next Septenarium is certainly not well founded.

## Of Fevers

The more distinctly a Fever is formed, and the more fully the more Security there is. The less Distinction there is — Remission & Exacerbation the greater Danger, for Remission gives always some Security. but when after the 7<sup>th</sup> day the pulse continues <sup>the</sup> w: its Fullness & Frequency, the Remission then gives more Security. One Exacerbation every day is dangerous, but two Exacerbations a day are more so. When Exacerbations are distinguished w: Horror they are more safe than without it. When they are only marked by Debility and Smallness of the Pulse they are peculiarly dangerous. Most Fevers end fatally on the 11<sup>th</sup> Days. Those that pass

*[Faint, illegible handwriting in cursive script, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the adjacent page, visible through the gutter.]*

of Fever.

over that day have then commonly a considerable Remission, and are of less dangerous tendency. every Vaccination <sup>2</sup> happens on <sup>2</sup> critical days of Hippoc: is more favourable than such as happen on the other days. the Appearances of <sup>2</sup> Urine proving critical are therefore more to be depended on then. the most powerful days are the 7<sup>th</sup> 11. 14. 17. 20. the 7<sup>th</sup> & 11<sup>th</sup> are more rarely to be considered as days terminating in Health, but from them the violence of <sup>2</sup> Fever begins to Abate gradually. the most perfect Resolution is when <sup>2</sup> Frequency of Pulse Abates apace. Thus I have often seen it brought down from 120 to 100, then to 80

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the adjacent page, visible through the gutter.]*

and lastly to 60. in the course of such  
a Revolution the pulse abates 20. or  
30 a day. -

of the Cure of Fevers.

Nature must not be trusted in the Cure  
of Fevers. her Efforts are often irregular  
dangerous & fatal. The Physician  
is the Servant of Nature we grant, but then  
he must direct - moderate & assist  
her Efforts.

The general Indications of Cure then

- are or  
1: To moderate the increased Action of the  
Pulse  
2: To Obviate Debility. —

The present situation of our  
 affairs is such that we are  
 compelled to suspend the  
 publication of the paper for  
 the present. We are sorry  
 to hear of the death of  
 our friend, and hope that  
 his soul may rest in peace.  
 We are, Sir, very respectfully,  
 Yours, &c.  
 J. W. Alden

These indications are adapted to the different kind of Liver. The principal distinction of these is into Inflammatory and nervous. to the Inflammatory kind the 1<sup>st</sup> to the nervous, the 2<sup>nd</sup> is adapted.

These indications are answered, then  
1<sup>st</sup> By Antiphlogistic Regimen - Bleeding - Glysters - Refrigerants - & Diluents. the 2<sup>nd</sup> By Diaphoretics - Vomits - Antimonial - Neutral Salts - cold Drinks - hot & cold Bathing - Blisters - Antispasmodics - and wine.

These are often intermixed, but it is most proper to speak of them first in particular, and then to point out the Circumstances.

The observation is related to the  
 different kind of power. The principle  
 of the observation is into the  
 and power. The observation is  
 the 1. to the power. The 2. is related.

of Fever

producing it is hurtful. Bleeding is improper. hence it is unsafe in all Intermittents, unless it is in those <sup>cases</sup> which occur in the Spring of the Year which are commonly attended w. <sup>the</sup> Inflam<sup>y</sup> Symptoms. In nervous Fever, and in the Sail Fever Bleeding has <sup>the</sup> most pernicious consequences. Bleeding sh<sup>d</sup>. never be used in <sup>the</sup> cold Litt of Fever.

— Topical Bleeding sh<sup>d</sup>. After be used for topical Inflammations. it relaxes w<sup>th</sup> out weak<sup>en</sup>ing the Patient.

3<sup>o</sup> Clysters belong in a great mea-  
-sure to Antiphlogistics, as they

of course

proceeding it is thought to be  
 important. Hence it is much  
 to be desired that it should be  
 given in the form of the  
 one commonly known as the  
 "Lithograph". In the case of  
 the last form the following  
 instructions for engraving  
 are given: "The engraver  
 should be careful to cut  
 the lines at right angles to  
 the direction of the  
 pressure. It is not  
 necessary to cut the  
 lines at all, but it is  
 better to cut them at  
 right angles to the  
 direction of the pressure."

remove the Irritation of hardened Lues,  
and according to the state of <sup>the</sup> Intestines  
are universally useful. they not only  
answer the Intention of evacuating  
the Faces, but of deriving <sup>the</sup> Blood ~~from~~ from  
the head. Cathartics as evacnants  
are used w: the same Restrictions as  
Blood letting especially those <sup>2</sup> evacuate  
w: little Irritation. but they are of less  
use as their power in evacuating  
cannot be so easily determined. in  
Bilious Fevers of hot Climates they  
are very necessary. as Abdominal  
Obstructions so often happen there. the

of Fever.

Antimonials. Where they act moderate-  
ly by Stool are useful, and very well  
adapted to this purpose. —

4.° Refrigerants are Acids & Neutrals.

Acids when properly diluted are fitted  
to quench the Irritation of Thirst, pre-  
vent the putrid Fermentation in the  
Stomach & putrefaction in the Lys-tem  
induced by Debility or Contagion.

Neutrals will be treated of under another  
Head.

5.° Diluents. Tepid water in promoting  
the Action of the Stomach & Intestines  
& the Circulation in <sup>&</sup> remote parts  
& Secretories - in relaxing <sup>&</sup> Lys-tem &

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

## of Typhus.

Sweats especially by heating Medicines.  
 - the most safe Diaphoretic in all Typhus  
 is warm water. Sometimes a Draught  
 of cold water is useful. But when warm  
 water is given the Bed Cloaths - At-  
 -mosphe<sup>re</sup> &c must by no means concur  
 to heat the patient, as thereby Infla-  
 -mations & fatal Consequences are of-  
 -ten occasioned. - all Remedies with  
 water are either hurtful or useless.

2<sup>o</sup> Vomity. Vomiting is a Symptom of  
 the cold L<sup>iv</sup>er, and when it arises from Spasm  
 on the Surface it will commonly be  
 removed by the hot L<sup>iv</sup>er. it often de-  
 -pends on a Communication ~~from~~ there is

I have the honor to acknowledge the receipt of your letter of the 10th inst. in relation to the above named matter. I am sorry to hear that you are unable to attend to the business of the office at present. I am, however, glad to hear that you are recovering from your illness. I am, Sir, very respectfully,  
 Yours, Sir, very truly,  
 J. W. Foster.

between the Stomach & the surface of y.<sup>e</sup>  
Body. its Action has a powerful Effect  
in determining to the Skin, & removing  
Spasms there, hence it promotes a Dia-  
-phoresis. The usefulness of Vomits was  
commonly ascribed to their cleansing the  
Primæ viæ from the prevailing Doc-  
-trine of Locus Morbi lodged in the  
first passages, & from y.<sup>e</sup> bilious vacu-  
-ations. But this does not hold good as  
we see y.<sup>e</sup> Vomits answer as well w<sup>th</sup>out  
producing any Evacuation.

3<sup>o</sup> Antimonials. These have been very  
commonly used in Livers since Churc<sup>e</sup>.  
Remedies were first introduced into practice

Antimony as a Febrifuge has been given  
in various Forms. The power of Anti-  
monials has been considered as depending  
on their Emetic Quality, but they do not  
not act merely as Emetics, but by continu-  
the nausea they keep up the Determination  
to the Skin for a longer time especially when  
given in small Quantities & by Degrees.  
For when given as Vomits they are hurtful  
by breaking, & are particularly so before  
the cold Fit. When given in small Doses  
they also Operate more effectually by Stool,  
and are therefore very well adapted to  
bilious Fevers where there Obstructions of  
the viscera &c being very convenient.

*[Faint, illegible handwritten text, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwritten text visible on the right edge of the page, likely from the adjacent page.]*

topical Laxatives. The best Operation  
of Antimonials consists in sickness,  
some purging <sup>in</sup> procuring Sweat. of  
all the preparation of Antimony <sup>Pasta</sup>  
I metta is the best, as being less acrid  $\frac{2c}{4:4}$   
Mercur: bte, more certain in its Dose  
than the Reguline ~~particles~~ preparations,  
& less liable to vomit than  $\frac{2}{4}$  binum  
Antimonialle. it is preferable to Spec:  
unless where we are afraid of its stimulus  
as having a greater power of affecting  
the Surface. As to the time of its Exhibition  
it succeeds at all times, but it seems to do  
most Service when given just before the  
Exacerbations of the Liver. its Dose is from  
1 Grain to 2.

of the same kind. The first of these  
 is the *Journal of the Proceedings of the  
 General Assembly of the Synod of the  
 North*. This is a volume of 100 pages  
 containing a full and complete account  
 of the proceedings of the Synod from  
 the first of January to the first of  
 January. It is a very interesting and  
 valuable volume, and is well worth  
 the attention of every one who is  
 interested in the affairs of the  
 Church. It is published by the  
 General Assembly, and is sold by  
 the Book Concern.

## of Fever.

4. Neutral Salts. These are also considered as Refrigerants. Nitre is so but not in consequence of producing Cold when thrown into water tho' this Supposition has been the Foundation of their use both in Nervous & Inflamm<sup>d</sup> Diseases. They act by Affecting the Stomach & determining to the Surface of the Body, as we see y<sup>e</sup> Draught of cold water produces soon after a glowing Heat & proves an Effluvia<sup>l</sup> Sudorific<sup>us</sup>. We also see y<sup>e</sup> Regenerate<sup>d</sup> is as powerful a Refrigerant as Nitre tho' it generates Heat when thrown into water. The Modus Operandi of these Salts is

Obvious. After a Dose of them a Sweat is  
 often produced. They certainly remove  
 some of the Effects occasioned by <sup>the</sup> Spasm  
 on the Stomach whence they prove Efficacious  
 Antiemetics. But <sup>the</sup> Choice of  
 them is difficult. The Neutral Salts w:  
 have a Muriatic Acid are powerful  
 Stimulants, & therefore only to be used in  
 Intermittents to obviate the Return of  
 the Fit. They must be given before the  
 Rational paroxysm comes on. Nitre is  
 commended as a Refrigerant, but it is  
 not only inferior to Acids in <sup>its</sup> virtue, but  
 often proves more Stimulant, & general  
 - by sh<sup>d</sup>? not be used so freely. The

*[Faint, illegible handwritten text, likely bleed-through from the reverse side of the page.]*

Preparations of  $\text{Z}$  are the safest Antic:  
-metics. I find no difference between  $\text{Z}$   
Sp. mind. and the Saline Mixture they  
sh. be given in sufficient Quantities. Re-  
-generate  $\text{Z}$  is very useful as also  $\frac{2}{3}$  of  
vitriol. but the difficult solubility of  
this last prevents its more frequent use  
here

5.° Cold Drinks. These by determining  
to the surface of the body & thereby  
producing Sweats have cured Fevers.  
but from their Irritation they are  
hurtful when there is topical In-  
-flammation or even an in flamm<sup>n</sup>.  
Diathesis. But in nervous putrid

& bilious Fevers they are very applicable.

6<sup>o</sup> Cold Bath. This has been very much used in Lilia & Rufia. It often moves  $\frac{1}{2}$  but Diaphoretic when the patient is directly put into a warm Bed. it acts in the same way as cold Drinks, and there may be cases where such a practice would be as useful as in putrid & putrid Fevers. Delirious people by getting into  $\frac{1}{2}$  cold air & throwing themselves into a pond have been cured. But such Cases are too few to establish so doubtful a Remedy in Fevers.

140

24

Vol 1

## Of Fevers

7<sup>o</sup> Warm Bath. This is a less preva-  
-rious Remedy than the former. Heat  
& Moisture combined are  $\frac{1}{2}$  most  
powerful Emollients w<sup>th</sup> Respect to  
Animal Fibres, & Emollients are ge-  
-nerally Antispasmodics. This warm  
Bath must be more effectual as it  
is applied to the seat of the Spasm itself.  
Hence we sh<sup>d</sup>. believe that it sh<sup>d</sup>. be a  
universal Remedy in all Fevers. But in  
Fevers w<sup>th</sup> topical Inflamm<sup>n</sup>. the uni-  
-versal Spasm is only symptomatic,  
hence it w<sup>d</sup>. be of little use to take of  $\frac{1}{2}$ .  
While the particular Stimulus remained.

of Fevers

warm Fomentation proves as effectual  
and as safe as Immersion. These  
warm Fomentations w<sup>th</sup> Blankets  
dript in warm water I mean should  
be continued for several hours or they  
will do no Service.

8.<sup>o</sup> Blister are a very noted & effectual  
Remedy in Fevers but somewhat am-  
-biguous. commonly they have been  
considered as Stimulants as they really  
are in some Measure, but they are  
at the same time useful in topical  
Inflam<sup>ms</sup>: where all Irritation is heart-  
-ful.

148

I am writing to you as I have  
 been thinking of you very much  
 and of the time we spent  
 together in the old days.  
 I hope you are well and  
 happy. I am well at present.  
 I am writing to you as I have  
 been thinking of you very much  
 and of the time we spent  
 together in the old days.  
 I hope you are well and  
 happy. I am well at present.

[illegible]

- hence they must have other Effects<sup>ch</sup>:  
 compensate their stimulating power.  
 they relax the inflamed part when  
 applied near it, in a Rheumatism<sup>2</sup> y:  
 external pain & Swelling relieves the  
 internal pain & Swelling. This relaxing  
 power of Blisters is not owing entirely to  
 the Discharge<sup>ch</sup> w: does not always take  
 place, tho' it is increased when attended  
 w: Vaccinations. in this Discharge no  
 Attention must be paid to  $\frac{1}{2}$  Quality of  
 the evacuated Matter, nor to any Suppo:  
 - ed Morbific Matter thereby thrown out;  
 but only the Evacuation shall be present

if the Blister shall effectually answer  
 their relaxing purpose. Their Effect is al-  
 ways in Relation to the state of the  
 Neighbouring part, ~~and~~ the Tension of  
 the whole System and y: of a particular  
 part are in mutual Relation to  
 each other, and therefore they may  
 lessen the Tension of the whole system  
 by diminishing y: of the part to which  
 they are applied, & hence by this relaxing  
 power they prove so useful in all univer-  
 sal Levers.

Blister however do stimulate in y: <sup>n</sup>  
 first Operation. Often in the first three

[illegible]

of Fevers

hours no Action of them is observed, & the Frequency of the Pulse not increased, but in the next three hours this Effect will not fail to appear. The relaxing power depends greatly upon the Discharge: hence we see that after the first 24 hours when the Evacuation begins to diminish, a second Inflamm<sup>n</sup> takes place attended w<sup>th</sup> new Symptoms often worse than the former. it formerly was believed the more painful a Blister was the more Benefit it would afford. but as long as the Cuticula lies it is no matter how long it is before the Blister be taken

157

of Fever

off. but when the Cuticle is removed, the Skin laid bare, and a Resinous plaster (as is common) applied, the pain in consequence of this will prove a stimulus, exciting greater frequency of pulse, and rendering all the symptoms worse again. I have seen a patient die merely in consequence of this unheeded carelessness.

at a great distance from  $\frac{1}{2}$  affected part in inflam<sup>y</sup>. Disorders Blister will prove hurtful as they produce an irritation when by the inflam<sup>y</sup>. symptoms are increased, on the contrary they are applied as near  $\frac{1}{2}$  part as possible w<sup>th</sup> considerable advantage. - tags.

The first of these is the fact that the  
 human mind is not a blank slate at birth  
 but is filled with ideas and feelings  
 which are the result of the influence of  
 the environment upon the child from the  
 moment of his birth. These ideas and  
 feelings are the foundation upon which  
 the child builds his character and his  
 life. They are the seeds of the future  
 and the soil in which they grow. The  
 child's mind is like a garden which  
 must be carefully cultivated if it is to  
 produce the best results. The parent  
 must be the gardener and the child the  
 plant. The parent must give the child  
 the best soil and the best care and the  
 child will then grow into a healthy  
 and happy man.

of Fever.

In nervous Fever where there is great debility Blisters may serve as stimulants, but Symplicisms are preferable. Many of our inflammatory Fevers at length turn nervous <sup>or</sup> is again a limitation of  $\gamma$ .  
Early use of Blisters.

The Effects of Blisters are transitory & never lasting above 24 hours & therefore they should be frequently renewed. to prevent the Absorption of  $\frac{1}{2}$  Cantharidis <sup>or</sup> des w. produces strangury muslin-lawn or paper sh<sup>d</sup> be interposed between  $\gamma$  & Plaster and the skin.

9. Antispasmodics. The chief of these

2 Opiates. <sup>ch</sup> w: are powerful in removing Spasms And therefore must be of use in Fevers. Opiates given before the Accession are known to cure Intermittents. There have been instances where Delirium of the phrenetic kind was cured by Opium gradually increased to the Dose of 5 Grains. Here however there was no Turgescence of the vessels of the head, nor was the pulse full. It is hard to tell when Opiates sh<sup>d</sup>. be given. as they are useful in topical Inflammations, I am apt to think this use in continued Fevers would be less safe. For their first Effect being stimulating, & their next sedative.

remarkable for its stimulating than  
 Antispasmodic Qualities 3<sup>rd</sup> Asafetida  
 w: some Practitioners have a good Opin-  
 -ion of, but I have not found it more  
 -agreeable w: Advantage. -

Volatile Alkali is certainly Anti-  
 -septic & hence very suitable to putrid  
 Fever. but the dose commonly given is  
 insignificant as an Antiseptic, but  
 it is also stimulant, & more stimulant  
 than Antispasmodic & hence must be  
 confined to the most pure Cases of Debility.  
 but this Stimulant is more transitory &  
 hence of less inflammatory Tendency than  
 Aromatic.

165  
22

of Fever.

c. Camphor. is still under some ambiguity. Under 5 Grains it seldom will have any good Effect. it is absolutely necessary to give it in larger Doses. Under 20 Grains it never stimulates nor increases the pulse. Above 20 <sup>gr</sup>g. it has a sedative power, but Above 7ij it is a dangerous poison. From ʒ to ʒss Grains it has an Antispasmodic power tho different from that of Opium. I have seen it several times cure Delirium without topical Inflammation.

d. Musk - the Antispasmodic Effects of this Remedy is established in Epileptic Hydrophobic, & Other convulsive Disorders.

of Fever.

When it fails we must accuse it, being  
seldom had genuine. it commonly  
produces Rub. and herein a profuse sweat.

10: Wine is in some measure allied to  
Antispasmodics tho in many Respects  
different. it comes nearest to Opium  
by its Ardent Spirit. but is more safe  
as its stimulating Effects can be more  
easily determined. it is even less dange-  
rous than its own Ardent Spirits be-  
cause this is tempered in the wine by  
the admixture of veg: Acid & water. it  
is also less inflam: in its stimulus than  
either of these two or the veg: Acids.

[illegible]

of Fever.

169

In consequence of the Above mentioned  
Mixture it quenches Thirst - resists pe-  
-refaction, & keeps Open the Belly.  
given in large Quantities it has the  
Sedative and Antispasmodic powers of  
Opium. in Fine as wine is our Com-  
-fort in Health, so it is our Relief in  
Diseases. —

The first Step in Practice is ascertaining  
or distinguishing Diseases, nor is it enough then  
by a general appellation, w<sup>ch</sup> comprehends a great Va-  
riety of particular Diseases, but if possible to arrive  
at the Species; it is however unavoidable to throw  
Diseases into Classes. We must characterize these  
but sh<sup>d</sup> also proceed to their Subdivisions, & unless  
we arrive at the Distinction of Special Diseases, we  
have not gone the length necessary for Practice: not but  
on some occasions we must practise on genera, & perhaps  
we have often practised on Diseases as a Class. It is ne-  
cessary therefore that these Nervous Diseases be subdivi-  
ded into several Orders. They have been divided according  
to the Parts that are the chief Seat of the Phenomena;  
but the Seat of Diseases employed as a Distinction  
has been objected to. That however regards chiefly the  
internal Seat w<sup>ch</sup> may be disputed; but when I speak  
of external Functions, the Phenomena there are ex-  
ternal & evident. upon this footing then Nervous  
Diseases may be divided into 5 Orders. 1<sup>st</sup> Those that  
affect more purely the Sensorium Commune, or have  
their Seat in the Origin of the Nerves, & appearing

the Disturbance of the Intellectual Functions.  
They belong to that Class w<sup>ch</sup> Sauvages has call'd  
C<sup>o</sup> Vesani; but the Class is not pure in this respect.  
He includes the topical affections of the origin  
of the nerves, the Hallucinationes, & morositates  
that consist in an affection of peculiar appetites.  
It is only properly Deliria that I speak of now, &  
is make one Set of nervous affections. — 2<sup>d</sup> Order  
are those that affect the muscular System, w<sup>ch</sup> it  
is difficult to limit w<sup>th</sup> precision; but the most  
Part of them consist in an affection of the Or-  
gans of Voluntary Motion. These are the Seat  
of the various Spasms, or more properly the  
several motus Convulsivi, & to the same head  
belong the motus Impotentia, & I think also  
the Comas. — & 3<sup>d</sup> Order are those that affect the  
Lungs & other organs concerned in Respiration  
connected w<sup>th</sup> them. So this belong the various ge-  
nera or Species of the Anhelationes Spasmodicae.  
& 4<sup>th</sup> Order of nervous affections may be reckoned  
those that affect the Heart. How far these affec-  
tions may on occasion be extended to the whole  
Sanguiferous System, or how differ in their

mode of affection from others that affect it as an Hydraulic System I shall not enquire but observe that Palpitations & Syncope are often Diopathic & make an Order. — The 5<sup>th</sup> are those which affect the functions of the alimentary Canal, & are those I consider as the Symptoms of Hysteria & Hypochondriac Diseases. Whether these are to be considered as the same or distinct, shall be remarked by & by. — These are the 5 Orders of nervous Diseases, but in regard to all of them it is to be observed, that from the Connection there is between all the Parts of the nervous System, these different Orders are often complicated w<sup>th</sup> one another. It will only occur in considering them more particularly, how we are to keep clear of the Confusion, that this Complication often endangers. They are just now to be distinguished upon a footing of Pathology I have often spoke of, as they appear to be Diopathic or Sympathetic. In short those that first arise in the Parts of the System, w<sup>ch</sup> I have distinguished as being more moveable, may be called Diopathic; the others that follow in the Succession of Phenomena may be considered as Sympathetic.

Of Nervous Disorders

177

& the Disease must be referred to that set of Functions, in w<sup>ch</sup> the Phenomena first appeared.

Now of all those 5 orders, the most frequently occurring & the most widely extending its Effects is the 5<sup>th</sup> affecting the alimentary Canal. In short, so far as they thus frequent, & thus extending over the System, that it is these we mostly have in view, when we speak of Nervous Diseases, & you will perceive accordingly, that under the general title of Nervous Diseases, it is chiefly to those appearing primarily in the alimentary Canal, that that title has been applied, & on that account it is these I propose to speak of. - But in proceeding to particulars very great Difficulties present themselves. These Affections both Idiopathic & Sympathic are so numerous, & at the same time so diversified in their Concourses & combinations that on that account so many Physicians have still had recourse to the general View of them as Nervous Diseases. - I believe we must often practise on that footing, but surely our Practice is not accurate nor can it be rendered Perfect,

unless we proceed to some Divisions, & till we attempt to find some Peculiarities in the various Combinations, & upon this found our method of Cure. but such is the Difficulty here, that even the Divisions attempted have been disputed, as also whether there is any well founded Distinction; I think it worth hazarding the Supposition. I will now endeavour to shew that there is among these various affections of the Alimentary Canal that have been so commonly called Nervous, a manifest Distinction to be observed, a Division to be made, & a division that leads to considerable Differences in the method of Cure. While I affirm this, I must however remark, that when we have distinguished them, such are the Complications that occur, that these very distinct Diseases may be so blended, that it is hard to say when we meet w<sup>th</sup> one or <sup>an</sup> other of them. Black & White are very well distinguished from each other, but maybe so blended in a grey by different Proportions of the two into an hundred intermediate Shades, that it would require a great Experience in

Colours, to say w<sup>ch</sup> of the two prevailed. But perhaps there are among these 60, in w<sup>ch</sup> the White prevails, & the other 40, in w<sup>ch</sup> the Black prevails, & perhaps we can divide each of these into four or five Series, in w<sup>ch</sup> we can determine very nearly the proportion of Black & White w<sup>th</sup> respect to each. So it is in nervous Diseases; they admit of no exact Limits, the Passage is by imperceptible Degrees of Shape & Colour; so that we can only exactly distinguish them, when at considerable removes from each other; but that is no reason why we should not use the Distinction when applicable. — With this Caution I say that nervous affections of the alimentary Canal may be observed to consist of two distinct Combinations & Concourses of Symptoms, that are in some measure as different from one another as Black & White. I shall attempt to characterize each of these.

1<sup>st</sup> The one Concourse is less constantly present & more depending on occasional & External Causes. The external Causes exciting it, are chiefly these or other Impressions affecting the Organs

of Sense, but more especially the first.

2<sup>d</sup> By Passions of the mind a particularly not so much a single Passion (except it both comes on suddenly & in a high degree) but chiefly the alternation of various agitating Passions. —

3<sup>d</sup> Sudden & Considerable Vicissitudes of the State of the System in any respect. —

The 1<sup>st</sup> then are distinguished by their external Causes, & in the next place they are distinguished by the Subjects they attack. They occur especially in young Persons near their Acme, or not long after it, except in so far as they are afterwards repeated by the occasional Causes & continue in consequence of a habit thus induced, but they chiefly happen in young Persons near their Acme. They occur likewise to a particular Temperament; that is Physicians have always characterized under the title of the Sanguine; Persons of smooth skins & transparent, this is the Bloodfuls discover their colour; of red & florid Complexions, therefore of a soft, & rather a Lax habit,

but w<sup>th</sup> that full & Plump, & commonly w<sup>th</sup> Pale  
 or Reddish hair. Such is the Concourse of appear-  
 ances in those of a Sanguine Temperament; when  
 I said Pale flaxen or red hair, I should have added  
 soft & Lank. Next it occurs to Persons frequent-  
 ly subject to Hemorrhages, & the Paroxysms of this  
 Disease happen chiefly about the time of the Erup-  
 tion of such Hemorrhages, sometimes immediately  
 before, & sometimes at its going off. Lastly the Con-  
 course I am speaking of, more especially attacks  
 the female Sex, & among these the Barren, that  
 either continue Unmarried, or married without bearing  
 Children. To this I would add that it is a Disease  
 of Warm climates; that there are more Hysterics in  
 England than in Scotland, & more in France than  
 in Britain. How this Progression extends further  
 South I cannot determine; but I generally see that  
 Persons from Warm climates are more subject  
 to this Disease, or if not to this, to the Analogous  
 ones of the Spasmodic kind. The Symptoms are  
 very commonly in a certain Succession beginning

186

## Of Nervous Disorders

at first w<sup>th</sup> the sense of a globe or Ball formed, in the Lower Belly, most commonly occupying one or other Hypochondriac Region; it occasions a manifest Inflation there, & a fulness, but soon moves from that variously thro' the Lower Belly; after moving there for some time, it comes into the Stomach, giving an Inflation, & perhaps Vomiting; commonly from the Stomach it proceeds along the Oesophagus to the gullet, where it remains as a mass impeding Deglutition & Respiration. We can see I think, that manifestly where it rises first, seems to be in one or other flexion of the Colon, from thence it passes w<sup>th</sup> an Impulsion of the Peristaltic motion thro' the Small Intestines & thus into the Stomach & gullet. But as it makes this Progress, the Containing Parts are affected; the Abdominal muscles are violently convulsed; the navel is observed to be drawn in; the Diaphragm affected w<sup>th</sup> Hiccups; the Lungs w<sup>th</sup> an asthmatic fit; & the Heart w<sup>th</sup> Palpitations: & thus rising by degrees, at length attaining the origin of the nerves, it produces Coma, Stupor, & Drowsiness,

### Of Nervous Disorders

& the former Symptoms gradually remit. These Symptoms are of a Temporary Duration, & it is perhaps necessary they should to induce some remission & relaxation; they recur again more or less frequently according to the return of occasional Causes, & to the Disposition of the Body being more fitted to be affected by these; for it is to be observed that they readily become habitual, & are excited by smaller Causes than at first gave rise to them; may they are in some measure under the Power of the Will, so that by recalling Passions that formerly excited them, the whole Phenomena will be reproduced. You will remember that in describing a Concourse of Symptoms, every one of them does not occur in every Patient, nor precisely in the same order; but we distinguish by a considerable number of them occurring at the same time. — now I say this is one Concourse occurring in consequence of particular Causes in particular People. There is another Concourse to be opposed to this, & you will easily remark the Difference —

of Nervous Disorders

2<sup>d</sup> The Symptoms here are more Constant, more permanent & subsisting in the habit more certainly than the others; they arise more from internal Causes, depending less on occasional ones, & particularly are excited by Causes that habitually weaken the System. All those that weaken the force & Tone of the System are productive of the Concourse I now speak of; & it is not the sudden agitating Passions, but particularly grief, a strong passion of that subsisting for a length of time, <sup>which</sup> gives rise to this Concourse. As to the Subjects it affects; it occurs chiefly in the Decline of Life, after the human System has arrived at its meridian, after the age of 39; It happens to a particular Temperament <sup>which</sup> Physicians have distinguished by the title of melancholic, i. e. those of less fine or smooth Skin, of a thicker texture discovering less the arteries & their proper red Colour shining thro'; discovering more the Veins, so that the whole surface instead of the florid Cast of the sanguineous habit, has a Leaden appearance; & <sup>the</sup> this, Black

hair of a pretty strong Crispature, a lean body, or at least less Plump than the Sanguineous. It occurs to those who are liable to a fallne<sup>s</sup> appearing in the Venous Vessels, to those subject to what we may call a Venous Hemorrhage, to Persons habituated to hemorrhages, but who have suffered obstructions, or to those who have suffered obstructions in the Determination to the Surface of the body, or to the Extremities. These two last Particulars will require some farther Explanation <sup>or</sup> shall be given when we treat of the particular Species; & lastly when the former Concurrence happens more rarely, this more frequently occurs to men. — again the Symptoms attending this are irregular Appetites, sometimes loathing, sometimes craving very often peculiar aliments; in the next place Indigestion, Uneasiness & Pain arising during the time of Digestion; when we discover the Indigestion we generally find an attendant of Acidity; along <sup>th</sup> these the Symptoms are a Heart burn, a peculiar Sense of Uneasiness; gnawing Pain; morose Ventriculi, or other more acute Pains at the orifice of the Stomach; a rejection of a

quantity of Clear Water from the Stomach, the *Pyrosis Succica* of Sauvages, or Waterbrash as we call it, partly squeezed from the Salivary glands, partly from the irritated Stomach, generally attended w<sup>th</sup> Pain of the Stomach, & perhaps Heartburn; w<sup>th</sup> these, frequent flatulencies in the Stomach & Intestines; In various Parts of the Lower Belly Pains that have the appearance of Distension, & as depending on Spasm, but more durable than in the former Concourse, & joined w<sup>th</sup> Symptoms not constantly occurring in it, together w<sup>th</sup> an habitual Costiveness. I would also alledge that this is a Disease of the Cold Climates, occurring less frequently in the Warm, tho' perhaps not exclusively; & it is remarkable that this is a Disease of the Cold Seasons generally, being spontaneously relieved by the Warmth of Summer. - both these Concourses have a considerable Effect upon the State of the mind, & very often are distinguished by their particular Effects on the Tone of it. The 1<sup>st</sup> affects it w<sup>th</sup> a remarkable mutability of the

Capious; this moment laughing, the next crying, & indeed all the Vicissitudes of Passion that can well be conceived occur in the first Concours; in the last Depression of Spirits & Pusillanimity prevail. —

Now here is a Description of two different Concourses, both comprehended under the title of Nervous Diseases, but w<sup>ch</sup> I think may be distinguished by calling the first Hysterical, & the 2<sup>d</sup> Hypochondriacal. — They have been so distinguished by the generality of Physicians. all the Galenists of the 16<sup>th</sup> & 17<sup>th</sup> Century constantly observed this Distinction, & adapted their Cure accordingly. Highmore ~~confuses~~ <sup>confounds</sup> these Distinctions, reckoning them to no purpose, & other eminent & considerable Physicians have been of the same opinion; but the most of those who have entered into the Study of them, have proceeded more or less to this very Distinction. There are still some who oppose this Distinction, yet in some measure refer these Diseases to the 3 Orders of Nervous, Hysterical, & Hy-

psychodriac. On this Subject Sauvage & Lin-  
 neus may be consulted, in whom you will find  
 the same foundation for the Distinctions, w<sup>ch</sup> I  
 have given. — I say we may understand  
 Hysteria & Hypochondriac Diseases as different,  
 & have distinct notions of them, as two not only  
 different, but in most respects directly opposite Con-  
 ditions of the human Body, & the Distinction is  
 altogether necessary — So far we have proceeded  
 to establish these two genera, but this is not suf-  
 ficient for Practice; We must go on to divide  
 them into Species. as we proceed in this way,  
 the Task becomes more difficult, but must be  
 attempted, as it will, I imagine, in most cases  
 lead to a different method of Cure. — I therefore at-  
 tempt to give you the Species of each of these  
 genera in a systematical method: calling  
 the first simply Hysterica, & the last  
Hypochondriasis. This list of them  
 may prepare you for understanding the method  
 of Cure. —

Of Nervous Disorders

you the species under these titles, as in the above list; not at all confident however that I have expressed the whole, nor certain that I have distinguished them very accurately. However I shall make a few remarks necessary for the Distinctions I would establish. — I first marked out the principal species of Hysterical Disease depending entirely on the Sanguine & Plethoric Constitution before described exclusive of any disease in any particular part of the System, & I maintain that this is the principal foundation of the proper hysterical Disease. We meet w<sup>th</sup> many instances, where merely from the occasional causes as agitating Passions &c, the Hysterical Symptoms as described above were brought on, continued & recurred: the menstrual Flux at the same time proceeding w<sup>th</sup> great Order & regularity. This furnishes a reason why we should not annex our notion of hysterical Complaints as always arising from the Uterus; but w<sup>ch</sup> opinion every one indeed now corrects. —

The 2<sup>d</sup> species is still an Hysterica Plethorica, but a mensibus suppressis vel retentis, whether the title "vel Haemorrhagis quibuscumque suppressis"

is" should be given, I dare not determine. I have met w<sup>th</sup> the Hysterical Disease in Persons liable to other hemorrhages, but have not had opportunity of observing it to arise from these. The only Case here meant is the Suppression of that Hemorrhage more strictly peculiar to the Female Sex; & this I likewise call an "Hysterical Plethorica" as I believe it is not questioned now that a Partial Plethora does take Place on such an occasion; & that is enough to give a Distension to the System, so as to produce this Disease. — To this Species I might have joined the Chlorotica. The Chlorosis depends commonly on a retention, sometimes on a Suppression of the menses, & therefore is connected w<sup>th</sup> the Species I speak of. But they may be distinguished in this manner. The Suppression of the menstrual Flux has different Effects in different Cases; for in many it causes the Symptoms of a Plethoric State, or that same mobility w<sup>ch</sup> arises from it; the Constitution in the meantime retaining its Vigour; the Countenance its Colour; & the alimentary Canal not being perhaps considerably

affected: There is another case of it where it induces a Weakness, the Stomach is considerably affected with all the Symptoms of the Hypochondriasis, & not only the alimentary Canal is thus affected, but the whole System appears flaccid, so that the quantity of red Blood is diminished daily, the Serum abounds & is ready to flow out in form of Faeces from the anus, or in other forms as of Sweat, the Chylipoetic Organs being greatly depraved. This last is what I mean by the Chlorotica. You will understand from hence that between the Hysterica & tentis menibus & the proper Chlorotica, there are all the intermediate Stages of a Plethoric State appearing; so that very often when the Chlorosis comes on, there has taken place the proper Symptoms of the Hysterie Disease. These two indeed are only to be distinguished by degree, but you will understand where we will apply one title, & where the other, & we shall find afterwards that they require very different methods of Cure —

## Of Nervous Disorders

3<sup>d</sup> Species Libidinosa. The Arabian Writers just, & afterwards those of the Southern Climes have made this remark in general that the Hysterical Paroxysm is commonly finished by a flow of Humidity from the Pudenda. In Sauvage un-  
on this title you will see how a Nun was cured by a ————— &

in Astruc you find what he hints as a Common Practice of the Women in France in case of an Hysterical Paroxysm, <sup>or</sup> is in short taking it off by exciting them to a Venereal Orgasm. This gives room to perceive that the Hysterical Disease is often of this kind, but from the rarity of the Case & delicacy of our manners in this Island, we have no opportunity of observing it; altho' it occurs in the Southern Climates. — But there is no doubt that the Hysterical Disease shews itself to depend on Tactility by producing all the degrees of Amorous Behaviour even to a Furor Uterinus. I would however remark that we commonly mistake the nature of this Hysterica Libidinosa. The most

common notion is, that it is from the want of enjoyment of that Pleasure w<sup>ch</sup> it is natural at the age in w<sup>ch</sup> this species happens, to desire; but this may not always be the case. There are many instances in w<sup>ch</sup> this species occurs, & at the same time so far from the want of Venereal Exercises, there is an uncommon Indulgence in them; & I have known several Instances of this kind in Persons who I have had pretty good Information indulged in that way & yet were exposed to what I may call Libidinous Paroxysms of the Hysterical Disease. May I have reason to believe the Disease occurs frequently from an over indulgence of that kind; We know very well that Salacity & Lechery gives an uncommon Mobility to the System, & exposes it to be affected by every titillation applied either to mind or body. These are often increased by habit, & are therefore a means even of renewing the Paroxysms; & therefore tho' we have mentioned but one species of the Libidinosa, there may be properly two. One from retention of the evacuations w<sup>ch</sup> should take place in the Venereal act;

& another from the Contrary, an Excess of them, altho' that Excess more commonly lands in an Hypochondriasis. —

To the *Hysterica Libidiosa* I have subjoined one w<sup>ch</sup> must be considered as different, viz. The *Hysterica Feminarum Sterilius*. In Unmarried Women it may be doubtful, when this takes place, whether they have had a sufficient Indulgence in Venery, or not; or if it arises from a Want of that Series of Conditions w<sup>ch</sup> Married Women should or ought to undergo. But in married Women in whom the first supposition cannot be supposed to be true, yet if they do not conceive, they are observed to be more liable to the hysterical Paroxysm, & therefore this is to be considered as a particular Species. —

all the Species I have mentioned belong perhaps to the *Hysterica Plethorica*, but there is another very different from these, viz. Ab Imaginatione. Instances of it from other Evacuati-  
ons than of Blood, we are not acquainted w<sup>th</sup>, but know that the hysterical Disease very often arises

from Hemorrhages, Spontaneous or Artificial.  
 I know some Women who cannot lose 3iv of  
 Blood, but fall into an Epilepsy & in some  
 Cases into an hysterical Paroxysm. There are some  
 who being liable to Inflammatory Diseases, are  
 obliged to use frequent bleedings, <sup>or</sup> for a long  
 time dispose them to hysterical Diseases. This  
 leads us to understand why a principal Species of  
 this will happen to those who are liable to an  
 Unusual menstrual Flux, either recurring too  
 frequently, or flowing too profusely. We have several  
 Instances of this kind, & there is none more  
 frequent than ~~that~~ from that Evacuation of  
 Blood sometimes very Copious & sudden, <sup>or</sup> happens  
 to Child bearing Women; hence all Women are more  
 or less liable to hysterical Ailments at the time of  
 m-lying, tho' perhaps at no other time. you will  
 see how they are liable to a particular relaxation  
 not only from the quantity of Blood taken off,  
 but also by removing the Pressure from the whole  
 Branches of the Descending Aorta in the Cavity  
 of the Abdomen; upon the removal of <sup>or</sup> they are

of Nervous Disorders

in danger of being seized to<sup>th</sup> an hysterical Paroxysm, unless this Compression be remedied by tight Swathing. Sauvages has added, what seems to belong to this head, the Leucorrhoea. This Disease may seem to arise from it, in so far as the too frequent menstrual Evacuations is commonly connected to<sup>th</sup> the Fluor albus in the Intervals. but from it alone, I have never met w<sup>th</sup> one instance of the proper Hysterica, tho many instances of the Hypochondriasis; indeed I imagine that no Evacuation w<sup>ch</sup> is slow & gradual is likely to produce the Hysterical Disease, altho very probably the Hypochondriac. Hence from many instances of Overabundant Menstrual Flux, we have, I think nine Hypochondriac Cases for one proper Hysterical. —

These are the Species of Hysterica w<sup>th</sup> I can distinctly mark. To these Sauvage has added another the Verminosa. I have not seen an instance of this, nor does he quote any from his own Experience, but from Delius, who seems given to collect extraordinary Cases. The Imitation however from Worms may produce hysterical Paroxysms, when the Constitution is more particularly disposed to them. —

## of Nervous Disorders

I next marked out the greater variety of the species of Hypochondriasis. The first of w<sup>ch</sup> I named Congenita, tho' I am doubtfull of the Propriety; some Writers have used the Term Hereditaria; It is the same w<sup>th</sup> the melancholia of Savages - It is like the first Species of Hysterica, depending entirely on the general State of the System, without any particular Organic Affection laying the foundation of it, but only sometimes following as a consequence; nor perhaps is it either produced from any External Causes, but the proper melancholic temperament is very constantly liable to occur at the Decline of Life. If this Species should be distinguished farther than by this temperament, I would observe that it differs from all the other species in this, that it affects the mind more than the Body, or at least affects the alimentary Canal more considerably than the other Species. Another Difference is that in other Species the Disease is more Constant; whereas in this from Causes not easily assigned, the Patient has very considerable Intervals, tho' it is indeed sometimes very permanent when it recurs. Of Nervous Disorders

has had two or three fits in his Life, & these sometimes at the intervals of a year & a half; the 1<sup>st</sup> Subsisted for 12 months together; & between that & the succeeding one he had an Interval of some years. —

The Second Species I mentioned is, "a Pathermate" as from grief, strong occasions of it long continued, or frequently recurring. This commonly does not differ much from the former because I have met w<sup>th</sup> few instances where it did not occur in the proper melancholic Temperament, w<sup>ch</sup> happens perhaps from this reason that other Constitutions are not so tenacious of any Passions, nor will considerable occasions of grief produce it, but in those who are predisposed thereto. However I must own I have met w<sup>th</sup> many Instances occurring in Persons of any habit, who were exposed to a long tract of Calamities.

Something like this occurs in the 3<sup>d</sup> Species "a Studis nimis": nothing more manifestly weakens the alimentary canal than much application to Study, in so far that this has been called the morbus Literatorum. But it is not confined to Study, but may follow an intense or long application of the mind to any business. The very assiduous Merchant

## Of Nervous Disorders

is accustomed to it as well as the Student, & it has been observed, that all men of considerable capacity who have been employed in great Affairs have sooner or later fallen into those irregularities of the alimentary Canal I speak of: But it happens from any Cause more frequently to the properly melancholic, for the same reason as before, that they are not only capable of longer studies, but confine them perhaps to a single object. For this reason mechanicians have been of the melancholic Cast; but at the same time I am convinced that a certain degree of application w<sup>th</sup> Constancy, & especially w<sup>th</sup> some anxiety will produce it in any Constitution whatever. —

The 4<sup>th</sup> Species "a nimia Venere": Here we begin w<sup>th</sup> observing as we did of the Hypochondriasis Exquiritas as I may call it, that tho' it may occur to the melancholic temperament, it is not confined to such. I have not known an instance of Impotence w<sup>th</sup> regard to Venery occurring in a proper melancholic Temperament, but have had an hundred Cases in the Sanguine, & have hardly had one, where the Patient was not frank enough to confess to what Excess

it had been owing, & it most commonly proved to have been occasioned by Excess early in Life in a most unsocial Pleasure. I have had 50 instances of it arising from that cause; a Venereal Impetus in the first place & in consequence of this affection of the Alimentary Canal. In all these the Patient was Pusillanimous & terrified w<sup>th</sup> false & dismal apprehensions; these are for the most part peculiar to the Species "a Venere nimia". It requires a very different method of Cure from what occurs in the proper melancholic Temperament.

The next is "ab Inanitione" w<sup>ch</sup> might seem to comprehend the last. Any considerable Evacuation destroys the tension of the System, ~~removes~~ that Stimulus w<sup>ch</sup> is the proper Cause determining the due Influx of the Divine Power into the whole of the System, but the Torpor occasioned by this means will be first felt in the Alimentary Canal. These Evacuations may be different; one in particular is from the Alimentary Canal itself; Long Diarrhoeas or Dysenteries leave it affected w<sup>th</sup> Hypochondriac Symptoms as Indigestion &c.

## Of Nervous Diseases

Whether or not a Diabetes is to be considered as a Cause or Symptom of this Disease I cannot determine; It is often a Symptom of the Cause, an unusual quantity of Urine in a pale or limpid State, or often <sup>the</sup> the ordinary Appearance is an attendant upon the Hypochondriacal Hysterical Diseases. There is no doubt that this Evacuation may be a means of continuing the Disease, so that it may be both an Effect & Cause; it may perhaps give a peculiar Species; but I have never met <sup>with</sup> an instance of this. — more frequent instances of the above Species arise from Evacuations of Blood, all profuse Hemorrhages & all considerable Evacuations by Bloodletting are capable of inducing the Hypochondriacal Disease, perhaps both because it does not coincide <sup>with</sup> the sanguineous Constitution or comes on at a time of Life when it is in some measure removed, or that these Evacuations are made by slow Degrees, & therefore more frequently produce the Hypochondriacal than Hysterical. So among Females, as I have said, those liable to too frequent Evacuations of the menses are in consequence of these more frequently affected <sup>with</sup> the Hypochondriacal than Hysterical Disease: The Fluor albus has rarely been followed by Hysterical

## of Nervous Disorders

Paroxysms, universally in the Hypochondriac. most of these last mentioned Transitions even attack frequently the Hysterical Constitution, but I may observe that as they produce Hysterical or Hypochondriacal Symptoms, they afford very different Indications of Cure—

To these I have subjoined the "Hypochondriasis Hysterica" i. e. an Affection of the Alimentary Canal brought on by frequent returns of Hysterical Paroxysms. I say that the Hysterical Disease appears at the approach to the Acme from 15 to 25. If it has recurred frequently at that Period, its Violence as an Hysterical afterwards remits, but leaves all the peculiar Symptoms of Hypochondriasis, & very often as one recedes, the other comes on, so that they are mixed at a certain part of their Stage, & give occasion to this Title; & it is due where that peculiar Sops of Sore in the Alimentary Canal constituting the Hypochondriasis may be imputed to the return of hysterical Paroxysms. These different States are like Black & White mixed to a grey, & make it difficult to w<sup>ch</sup> genus the Disease should be referred—

7<sup>th</sup> Species, "Hypochondriasis Empnactica" from Obstructed Viscera.— It is difficult to give the External

### Of Nervous Disorders

marks of this, as it only appears in consequence of Dissection of the Viscera, & even then <sup>the</sup> Ambiguity; as it is difficult to say whether these Visceral Obstructions were the Cause or Effect of the Disease. However where we can discern any marks in the beginning of the Disease as a Cachexy from an Accumulation of blood in the Sinus of the Vena Portarum, or hardness in the Liver or Spleen, I say when these can be perceived we have little difficulty in determining the Species. But in other cases where these Symptoms do not appear, or where the Disease has long subsisted w<sup>th</sup> them, it is hard to say, whether they are Causes or Effects, as the Continuation of the Disease constantly terminates in Visceral Obstructions. We must seek out the Cause however, as according to that the Disease will require particular Methods of Cure. —

8<sup>th</sup> Species. "Hypochond: a suppressionis Evacuatio-  
onibus quibuscunque". There are many instances where the body has been liable to Evacuations for a length of time, a Suppression of w<sup>ch</sup> has produced this Disease. A Diarrhoea or Dysentery suppressed

have left Hypochondriac Symptoms, but this more frequently happens from a Suppression of Evacuations of blood as the menses or Hemorrhoids. If you allow us to characterize hysterical & hypochondriac Diseases I would say that obstructed menses tho' an affection of the uterus, do not when gradually brought on, so commonly produce the hysteria as hypochondriac Disease. It is true that in young women the sudden Suppression of them at the time of their flowing from external Causes, will produce the hysterical disease. But where these Causes operate more slowly, except in the highly Plethoric, they produce the Hypochondriasis, not the genuine Chlorosis. Suppressions likewise of fluxes of blood from the nose, Lungs, or Hemorrhoidal Vessels in men are commonly attended to such Symptoms as may be called Hypochondriac - a very curious question offers itself here, viz. whether the Hypochondriasis arises in this Case from a different distribution of the blood introduced, or merely from that obstruction being accompanied to such a loss of Tone as we see manifestly produced in the Chlorosis. But

Of Nervous Disorders

this is to be avoided as being a theoretical question. —

The 9<sup>th</sup> Species, "a repulsio", from the sudden drying up of Issues or Setons or Ulcers from Mercurial Causes, or repelling Eruptions from the Surface, all of these have produced at one time or other an Hypochondriasis, to be cured by special management. —

The 10<sup>th</sup> Species, "a Febris Interrupta". Several Physicians have believed that an Intermittent Fever especially in its various forms, has a tendency to a certain limited Duration. Sydenham imagined he could determine the n<sup>o</sup> of Days it would subsist, & from that opinion some have thought it not safe to stop an Intermittent till it has run thro' its course. It is not easy to determine this question, but it is evident that so many Physicians have suspected it, & I have had several instances of Persons affected w<sup>th</sup> the Hypochondriac Disease, that were liable formerly to an Intermittent Fever, w<sup>ch</sup> by Cold or other accidents being suppressed, the Effects were a Hypochondriasis. —

11<sup>th</sup> Species, "Hypochond. Arthritica". I have last subjoined two Species w<sup>ch</sup> I thought proper to connect together, but how they are really connected is at the same time difficult to say. Every one acquainted w<sup>th</sup> the

## of Nervous Diseases

History of the gout knows it is a peculiar affection of the Extremities, tho it appears in the Stomach & alimentary Canal, & that the regular Paroxysms seldom come on without some previous affection of it. It must be owned that if it recedes, it may attack the head or Lungs &c, but it more frequently appears in the alimentary Canal. I have known many instances of the arthritis in Persons, who foresaw the Paroxysms by a number of hypochondriac symptoms some weeks before the attack; & we have had instances of its being cured by the gout appearing in the Extremities. What is the Connection, or how far it depends on a peculiar matter wandering from one part to the other, is not proper now to determine. —

<sup>th</sup> 12. Species "Hypochondriasis Nephritica". I have had many instances of Persons being forewarned of Paroxysms of the Stone by hypochondriac symptoms in the Stomach, as likewise of men laboring under these symptoms being relieved by a return of the nephritis. How an affection of the Kidneys is thus communicated to the Stomach is difficult to say; but if we consider how often the arthritis & nephritis are combined, we will suspect the intercourse of each w<sup>th</sup> the Stomach to be on the same foundation. —

## Of Nervous Disorders

Having thus pointed out the several species of these Diseases, I should now proceed to the method of cure. But according to the Plan laid down of treating every subject in a Dogmatical manner, we must first say something of the Proximate Causes of these Diseases, & however I must do shortly. —

Causa Proxima) The Proximate Causes of these Diseases is to be founded on the Consideration of the two temperaments, w<sup>ch</sup> I assign as the foundation of the two different genera. In these it is founded, & from the Consideration of these, it is to be understood; here is the Plan of reasoning I employ.

In the Sanguineous & Nystenic Constitution there is a Laxity of Fibre. Whether a laxity of the simple Fibres alone, or if there is also a weakness of the Tonic Power & that these two are connected, may be disputed. However there is in fact a Laxity of Fibre; this gives occasion to a more easy distension of the arterial System, & while the Constitution has not a force suitable to resist this, accumulations must arise there & that is strictly a Phthoric State of the arterial System. The Tension depending on one hand on the distending fluids, & on the other on the

Contractility of the Vessels: When the distending Power prevails, this as being a constant Stimulus, gives not only more Irritability, but renders the System like a machine whose action depends upon a variable impulse of fluids upon it, & on a friction of its wheels, more moveable, giving it a remarkable variable mobility, & particularly exposing it to be affected to every small change of the tension of the System, or even of particular Parts of it. The nature of this Temperament therefore consists in a mobility of the System, whether that depends on Irritability alone, or on Sensibility also increased, & therefore more readily producing Irritation, I shall not say. This mobility however must expose to an Ataxia, an irregular motion of the nervous System. All the Symptoms of the Hysteria & most of the Hypochondriac Disease, as Sydenham observed, depend on an Ataxia or an Irregular distribution of the nervous Power, i. e. its being sent to too great force, or in too great quantity into one part, & to too small force & in too small quantity into another. It is true this does not touch the fundamental & Proximate Cause, but I maintain that Sydenham judged rightly. In the next place these Irregular motions in such Constitutions as

are mobile, may be produced either by a Stimulus, or by the Want of the usual Stimulus, i.e. by a Relaxation or remission of the usual Tension arising from the Stimulus. The Effects of Stimulus in producing a more copious Influx of, or more Impetus in the action of the nervous Power will be easily understood; The Effect of Want of Tension or Relaxation is perhaps not so obvious. But consider what happens commonly in every *Delirium animi* from whatever Cause produced; There is a suspension of the Influx of the Nervous Power into the Vital organs & seemingly into the whole system; it is irregular for you see it is very constantly attended <sup>to</sup> Convulsive motions. There are innumerable other instances of this kind; Every one knows how much taking off the usual Support from a Part gives a Tremor or Spasmodic affection to it. Is any liable to Cramps in his Limbs, does he not find how they depend on a particular Posture? He knows that if he presses his foot against the bottom of the bed, <sup>or</sup> gives the due tension, he prevents the Spasm that would otherwise occur, & getting into an erect Posture is another remedy of the same kind. — In-

## Of Nervous Disorders

numerable other instances might be mentioned to show that want of tension or relaxation will immediately induce an irregular influx of the nervous Power, & it should be added that while the Disease depends on mobility, & consists in an ataxia, <sup>the</sup> it may be produced by these various causes, it may extend itself to every Part of the nervous system, <sup>the</sup> I mentioned as being of most variable tension.

Thus you have the nature of the Hysterical Disease & a foundation for an Explanation of all its symptoms. —

On the other hand in the Hypochondriacal depending on the melancholic Temperament, we find a rigid fibre <sup>the</sup> which gives a strong Contractile Power, & therefore a better Counterpoise to the distending blood, a firmer & more accurate tension over the whole system, but by prevailing particularly in the arterial Part, necessarily throws a greater quantity of blood on the Venous, & therefore gives the Venous plethora, by <sup>the</sup> this Constitution is distinguished. This more accurate tension in the whole of the system gives less mobility, such as even appears in some measure to resist what we may suppose the action of the Prime mover in the origin of the nerves

<sup>st</sup> Distributes the Tonic Power; I say we can con-  
 volve this motility to be so deficient as to exceed  
 this action. This rigidity gives a Torpor <sup>ch</sup> not  
 only implies a less irritability but a less share  
 of the Tonic Power; <sup>ch</sup> Torpor is more especially  
 to be felt in the Alimentary Canal & in other organs  
 that want the Stretching Powers & depend entirely  
 on the Tonic. Now this is a general Idea of the  
 two States of the Body under these Diseases, but I  
 should add that I now referred them to the general  
 Constitution of the Sanguineous & melancholic  
 Temperament, but that in the last particularly,  
 the Torpor & Languor of the Nervous Power appear-  
 ing in the Alimentary Canal may be induced likewise  
 in various Constitutions by every weakening Cause,  
 & therefore there may be a foundation for the two  
 States of Hypochondriasis; the 1.<sup>st</sup> depending on the  
 Temperament, the other accidental, or depending on  
 Causes weakening the System. But what chiefly to  
 be taken notice of is, that these two Temperaments  
 are directly opposite, the one exceeding in Mobility,  
 the other faulty in Torpor; & that from Theory as  
 well as facts there is a foundation for the Distin-  
 ctions between these two Sets of Diseases. I must

of Nervous Disorders

ad that tho I have supposed them both connected in the whole System; it must however be acknowledged that they depend more purely on a peculiar State of the Nervous System, on a peculiar Constitution of the Origin of the Nerves, independent of the general state or distribution of the Nervous Power that occurs in the Sanguiferous System. This opinion we are led to, from finding so many instances of the Power of Imagination producing the Phenomena of both Diseases, but especially the Hysteria.

Among the various Causes that may induce this peculiar State of the Nervous System, of the Sensorium particularly one may be, a peculiar Acrimony applied to the System, & peculiar Matter introduced into the Body affecting especially the Nerves, as we evidently see in the Case of many Poisons, that will act on every Constitution; & many act in producing a peculiar Sensibility & Mobility in the System. Besides these Cases of Poisons, where the Effects are more evident, I will not deny that there may be a Suspicion of various other Acrimonies subsisting, because I take no further Notice of it,

## Of Nervous Disorders

as it is for the most part hypothetical. I do not know any instance in w<sup>h</sup> we can beforehand discern it or direct our Cures against it. The Conclusions favouring the Existence of acrimonies have been drawn from Events, perhaps from Symptoms preceding Evacuations or Eruptions taking place; but these are all imaginary, altho' weighty arguments have been used in their favour. Nay tho' we know a Poison or Acrimony to subsist, this would have no Influence on the Practice of Physick, because our remedies are not directed to expell the Nature of the offending acrimony.—

Methodus Medendi. as I have marked out the two genera as different, so I shall treat of them separately. & first as to the Hysteric Disease. The method of Cure turns on these general Indications, To remove the present Paroxysm, & in the intervalls endeavouring to prevent a return.— We endeavour to remove the present Paroxysm, because sometimes, tho' not often, they have proved fatal; & independent of immediate Danger we know they considerably affect the Constitution, so as from

## Of Nervous Disorders

their violence & frequent repetition to induce a habit;  
 This is therefore always a Part in the method of Cure.—  
 In taking off the Paroxysm we have in view in  
 some measure the diminishing the Plethoric State,  
 which is the foundation of it, or what particularity ex=  
 poses to accident from the Violence of the Fits; as in a  
 Plethoric habit there is danger from the blood being  
 forced to too great violence into particular Parts  
 of the system, & therefore Bleeding has frequently  
 been thought a means of taking off the Paroxysm.  
 The Use of it depends on a nice Judgment; how far  
 the Precaution just mentioned is necessary, how  
 far a Plethora prevails & requires Evacuations or  
 threatens the consequences I speak of; Physicians  
 have only given general rules as to this matter,  
 & left a great deal to the sagacity of the Practitioner.  
 all that I have to say is that Bleeding in the  
 first fits of the Disease is generally both necessary  
 & safe, unless we can manifestly discern it has  
 rather arisen from Inanition than Repletion, but  
 however in the first Fits it will be commonly prac=  
 tised with success, particularly in manifestly full

Of Nervous Disorders

habits. but as Evacuations encrease the mobility of the System on w<sup>ch</sup> this Disease depends, & under repeated fits it is generally found to be rather of bad Consequence, & in habits not remarkably full or suspected of Inanition it may be certainly hurtfull, & therefore in general the Practice of V. S. is to be used w<sup>th</sup> great Caution, & much oftner avoided than performed. — The other means respect the Disease as it turns out in its Progress throwing the Person into a kind of Deliquium animi, or at least rendering her Comatose; for while it begins w<sup>th</sup> violent Spasmodic Affections, it ends in the Comatose State manifestly affecting the Nervous Power; its influx into the several Parts being very much suspended. To rouse the Senses Stimulants have been thought of. Of these Stimulants there are two remarkably Powerfull & immediately applicable as exerting very quickly their Powers, viz. Heat & Cold. as to the first especially applied in the form of Bathing, Dr Whist has very properly pointed out its Extensive Use, & we have frequently seen the good Effects of the Pediluvium; He advises it for recovering Hysterie Patients, but as he ob-

*[Faint, illegible handwriting visible on the right edge of the page, likely bleed-through from the adjacent page.]*

## Of Nervous Disorders

nerves, so I have frequently found, that there are Cases  
 in <sup>which</sup> it is entirely ineffectual; he takes notice that  
 in the more remarkably Plethoric it is of less use  
 & I add of less safety in so far as it is a Stimu-  
 lus to the whole System, by rarifying the blood.  
 But in Persons that are more loose in their vessels  
 & under a less Plethoric Distension, & especially  
 when there is a Suspicion of the Disease arising  
 from Inanition or an Inequality in the Tension of  
 the System, & particularly where it does not come  
 on from sudden Agitations of Passion, but from  
 more obscure changes in the System, & if therewith  
 it discovers its approach by a Coldness seizing the  
 Extremities & encreasing till it forms the hysterical  
 Paroxysm; In these Cases it is one of the most  
 effectual remedies. — I speak now of the hysterical  
 Paroxysm as more limited, & not of the several  
 Symptoms of the hysterical Disease, in <sup>which</sup> we  
 may also proceed perhaps to the Semicupium,  
 which is a general Stimulus to the System, exciting  
 the Tension on the Surface of the Body, & there-  
 by restoring it more fairly over the whole. — The

## Of Nervous Disorders

Effects of heat applied w<sup>th</sup> humidity are the most salutary, & therefore the Pediluvium is preferable to Potus. You will easily understand the Rationale of its operation. —

Another very Powerfull Stimulant, & very suddenly applicable is Cold. I shall afterwards say of what considerable Power it is in preventing the return; but its Effects in time of the Fits are more ambiguous. If we could apply it to the whole system at once while the Spasm subsisted, it might be Effectual in quieting them; but it is more doubtful, when applied to particular Parts in giving an Unequal Tension, diminishing perhaps the Influence of the nervous Power into that part to w<sup>ch</sup> applied, & thereby only serving to aggravate the Disease. It is ambiguous in many Cases on this account of its application; & likewise we cannot measure its Effects on several Systems, as it acts differently on different Patients. I have found that immersing the hands in Cold water or sprinkling the face w<sup>th</sup> it upon the first approach of a Fit entirely diverted it, & at other times more effectually

brought it on. But when the Fit has advanced  
 & a Comatose State come on, there I very frequently  
 find Water thrown on the Face or immersing the  
 hands is one means of more quickly restoring the  
 Patient. —

Another Set of Stimulants are taken in  
 the form of Medicines. Whether all these are to be con-  
 sidered merely as Stimulants, or at the same time  
 as Antispasmodics having a particular Power of  
 correcting the motions of the Nervous System, I  
 dare not determine. They are however of a par-  
 ticular kind, at least Stimulants in general  
 not being equally Usefull. We choose those that  
 are most active & therefore most commonly the  
 Volatile alkali, applying it to an organ com-  
 municating the Stimuli applied very readily to the  
 whole System, i. e. the Organ of Smell, for I  
 need not say that in hysteric Cases there is not  
 room for introducing medicines into the mouth  
 & Stomach. This Volatile alkali seems to act  
 directly as a Stimulus, but when we go to the

Other remedies commonly ~~applied~~ employed as the various Empyrenumatic Substances, viz. Burnt Feathers, or other animal Substances; there is a mixture of qualities, some degree of Volatile alkali, but a more considerable one of an Empyrenumatic oil is exhaled; how that therefore acts, whether as a Stimulus or Antispasmodic, or what is the nature of its operation, I dare not determine.

Analogous to these Empyrenomatics are the Rosil oils. Oleum Succini is the chief form of these & is commonly on this occasion employed. I mention it now for the sake of this remark, that <sup>it</sup> we have in the Shops will be an ineffectual remedy; I have not in many years found it genuine or pure, have frequently examined it, & found its greater Part to be oil of Turpentine, <sup>which</sup> is of much less Effect than the genuine oil of Amber <sup>which</sup> I believe is a peculiar Stimulus & maybe a very powerfull remedy on this occasion. I said just now that we cannot apply these Medicines but to the Nose, as they cannot

## of Nervous Disorders

be introduced into the Stomach; but there is another way that may be thought of, viz by Glyster, tho' we are sometimes even excluded from that by violent Spasms of the Sphincter ani. When this is not the Case, it may be another means of applying remedies for exciting Persons under the Comatose state of the Hysterical fit; & I am put in mind of this by finding that the fopid oil exhibited in this manner is more Powerfull than many other fetids that have been suggested. These are the means of removing the hysterical Paroxysm. — The other Indication is to obtain an Interval & prevent a return — To consider this fully we must look into the various Species of Hysterical Disease, & observe that these depend on particular Causes. In short all the Species except the pure Plethoric without any particular organic affection must be regarded as depending on that particular Cause & therefore requiring a special method of Cure. —

We shall chiefly insist on the more general

Of Nervous Disorders

Cure where the Disease independent of any particular Organic Affection depends on a general temperament predisposing, & only arises when excited by occasional Causes. The 1<sup>st</sup> Consideration then, must be certainly the avoiding occasional Causes. With regard to it I only observe that it must be of difficult Execution where the Passions or Appetites of men or Women are the chief of these Causes. If for instance the Occasion is an Excess in Venery, when shall we be admitted to the knowledge of this fact, or what interest can we use to prevent the Repetition. If in other respects it depends on agitating Passions, we shall find it difficult to instill into our Female Patients much Philosophy, so as to guard against these. This I can say for the comfort of every Practitioner on such Diseases, that he can throw the blame on the Patient for not avoiding occasional Causes; however I would venture to say that a sagacious Physician will discern & upon many occasions be able to direct & assist the Patients Will in avoiding them, I have

of Nervous Disorders

run many Examples of such sagacious Practice,  
 that purely turned on discerning & directing the  
 Patient in this manner, or inducing the By-  
 standers. But that is not the proper province of  
 the Physician, except so far as he is a Divine  
 or moralist, & I will not pretend, gentlemen,  
 to make you. — What more properly belongs to  
 the Physician is curing the Predisposition of the  
 Body, or putting it in a Condition to resist the  
 Power of these occasional Causes. With regard  
 to this Predisposition we may observe that it of-  
 ten depends on the Plethoric State of the System.  
 We think we may obviate that by taking off  
 the too great Distension by evacuating a Portion  
 of the fluids by bloodletting. accordingly it is u-  
 niversally prescribed, & in so far as it is the Hypo-  
 trica Plethorica & Exquisita it may be Usefull;  
 but it is to be observed that it is a very precarious  
 method of curing the Plethoric State. When  
 that indeed threatens immediate bad Effects  
 it is unavoidable; but we cannot prevent the  
 recurrence of the Plethoric State merely by U. S.,

## Of Nervous Disorders

may it is found to induce a decrease a Plethora.  
 There is the first Difficulty that occurs in the management of the Plethoric State by Bloodletting. It would require a very nice attention to judge of the quantity, as I may say, of Distension & to use U.S. again before that State arrives, & so to go on from time to time. We could indeed diminish the quantity taken at each bleeding, but it should be attended to, that at the same time we perform U. S. <sup>th</sup> this View, we may not only not cure the Present Plethoric State, but if we go a little too far, we may produce the Disease afresh, & bring on more harm than the Plethoric State occasioned. For this reason I have already observed to you that this Disease may depend merely on an Excess of Bloodletting. I have had an instance of this within these 8 days. an hysterical Paroxysm & various other symptoms connected <sup>th</sup> this, was imputed to the following Circumstance. a full young woman being by accident exposed to Cold during her menstrua, the flow of them stopt: She kept this a Secret from her Physician, but finding as she imagined a Suba-

tion is<sup>ch</sup> was the Effect of an over Distension,  
in consequence of w<sup>ch</sup> she practised V. S. 3 or 4 times  
pretty freely on herself, by means of w<sup>ch</sup> this Dis-  
ease was brought on w<sup>ch</sup> she has laboured un-  
der for a year or two. The Management there-  
fore of blood letting in Hysteric Cases is a nice  
Practice, either as to effect the Design of dimi-  
nishing the Plethora, or because it exposes to  
a contrary Condition, i. e. produces Inanition  
w<sup>ch</sup> as certainly brings on the Disease. I would  
therefore say that tho' there are many cases  
where the Disease is recent & in Plethoric ha-  
bits in w<sup>ch</sup> it may be admitted, yet I would  
never recommend obviating a Plethora by this  
means. I think a much more Effectual me-  
thod is by a proper Diet. It has been con-  
stantly observed that a full diet disposes Wo-  
men to this Disease, & that accordingly the  
wealthy are more affected w<sup>th</sup> it than the Indu-  
gent. There is no doubt that the only effec-  
tual means of obviating a Plethora is by low  
Diet & Exercise. But in the attempting it

## Of Nervous Diseases

in this manner a difficulty occurs particularly in the Diet of hysterical Persons, owing chiefly to this, that Practitioners do not distinguish the hysterical Disease from the Hypochondriac, i.e. where it appears in its proper form, & where by a Continuance it has produced that more habitual Disease of the alimentary Canal, & therefore a number of Patients that may be called hysterical will not bear a low Diet. If you do not give the Stomach its usual Stimulus & consequent tension you expose it to the various symptoms that occur in this latter Disease; & therefore two kinds of Diet may be employed according to these Circumstances, one to the Hysteria, & that is a low & a Vegetable rather than an animal Diet. But it should be remembered that if a Person has been used to Meat & Wine, you will effectually bring on the Hysterical Disease by abstracting that suddenly & by throwing in a Rascient & flatulent Diet. The Hypochondriac Disease is commonly taken for the Hysterical, & consists

278

in that disorder of the Stomach, that so often produces Cholic & Flatulency, requires a very different Diet from the peculiar hypostenic constitution. I have known Hypostenic Diseases cured by low Diet, a nature often suggests this; these Patients having often a Craving for acerbent food, & their Stomachs will only bear such. I know a young woman whose only food for several weeks was Apples, & under that very abstinence & Cooling acerbent Diet, she was free from the Paroxysms than when she took any thing more stimulating. You will easily judge from the Hypostenic Disease approaching gradually to the Hypochondriac State, & being attended w<sup>th</sup> Disorders of the Stomach, how the Diet is to be regulated. Another method of preventing the Returns is by diminishing the mobility of the System, <sup>or</sup> is done by various means, & 1<sup>st</sup> the management of the Capions. These have great Power of variously moving & agitating the Nervous System. But they are of different kinds, whilst some are Instigantia or causing these motions, others are Reprimen-

trā diminishing mobility, & taking of entirely the  
 force of the Nervous Power. Among the last & a very  
 powerfull one in preventing irregular motions in  
 such moveable Constitutions is Fear. Its Effect  
 is however very ambiguous, & is frequently one of the  
 Causes by which they are excited. Where the Irritability  
 or perhaps Sensibility is encreased every sudden  
 motion & particularly a Stroke of Fear is a means  
 of bringing on this Disease. It happens to this as to  
 every Passion that it is impossible to measure its  
 Effects; even the *Pathemata Reprimientia* will not  
 always have a more repressing Effect but will excite  
 to action. If a Person is affected w<sup>th</sup> Fear, it often  
 excites him to action in order to repel the Cause of it.  
 It is therefore impossible to measure the Degree that  
 will produce the Effect we desire, & on this account  
 tho' none are more Powerfull than Fear, it is rarely  
 we can employ it. I mention Fear here, because  
 I have known many instances of its Solitary Effects,  
 where Persons altogether impotent were immediately  
 rendered sound & continued so during their future  
 Life. It is likewise a considerable remedy in  
 various Convulsive & Epileptic Diseases; I used

not mention the remarkable Case that occurred at Haerlem, & I have seen several instances where by a permanent fear of somewhat future, or permanent grief (which is known in Practice so often to cause the Hypochondriasis) has proved a cure for the hysteric Disease in its various forms. This happened in this Country particularly in the year 1745, when Physicians in general agreed in this observation, that of their numerous Nervous Patients that were constantly complaining, being kept during that season under constant anxiety & apprehension, the greatest Part remained perfectly free from their Complaints. And I have known Persons long liable to Nervous & particularly Hysteric Complaints that have met with a considerable Calamity in their Family, which People apprehended would aggravate their Disorders; but this I say had the contrary Effect of relieving them, till that particular impression was again worn off. I therefore think it proper to mention these Effects of Passions, while I am speaking of the Cure of this Disease. —

284

## Of Nervous Disorders

Another remedy to be taken notice of as diminishing the mobility of the System, & giving it that Tension necessary to obviate the returns of this Disease is Cold applied to the Body.

The manner of its operating I have difficulty in explaining. In the 1<sup>st</sup> place we think of its operating on the Animal body as an Inanimate machine, by condensing its Substance & therefore increasing the firmness of the simple fibres.

In so far as it could produce this Effect, it might obviate the Disease so much connected with Laxity; but little can depend on this, for if applied to the surface of the whole body, it does not by its cooling Power penetrate to any considerable Depth, & therefore cannot give a general rigidity to the simple fibres as inanimate; its Effects therefore are to be sought for in another way. Cold applied to the Body for a short time has a manifest stimulating power w<sup>th</sup> regard to the whole System. If the Hands are immersed in Snow, they become red, & plainly shew a strong Influx of blood into them, & soon after

a heat following. In this & in many other instances it appears to be a Stimulant, & as such I mentioned it before as a means of recovering Hysteric Patients. In this way it may increase the Tonic Power, & may be a means of removing its mobility rather than in the other I mentioned. But independent of Stimulus by occasioning a Contraction of the moving Fibres within the reach of its action it must extend that Power over the whole system, & thus have considerable Effects by giving Strength to the whole. It may be doubted whether we can add that it acts in diminishing the mobility of the nervous Power. We know when carried to a certain length it will entirely destroy its mobility, whether it acts thus in the way we employ it, I will not say, but think it probable. Therefore I think the reason now appears of the proper Hysteric Disease that depends on this mobility occurring less in Cold Seasons & Countries, & therefore instead of the Cold Bath, I think that Persons living in a Cold Air is a chief means of preventing them

## Of Nervous Disorders

of the Disease, you know that in this Country the Atmosphere is colder than our Bodies, & that it acts as a permanent Cold, but is not so powerful as to become a Stimulus & that we are liable to Hysteric Diseases; a Cold therefore & fresh air is a considerable remedy. I therefore imagine it is that Cold bathing not as we manage it by a Dip but confining the Patient in it for several hours is so Effectual. Mons<sup>r</sup> Pommé has mentioned these Effects in the book he has published; w<sup>th</sup> regard to w<sup>h</sup> however I would observe that he is indeed a man of singular Character, vastly more forward in decrying & throwing Contempt on other Practitioners than most Authors that have appeared, w<sup>h</sup> gives us Suspicion of quackish manners. His Behaviour is far from that modesty that attends men of Probity & genius; he is again sufficiently confident in giving Theories, but the most futile that can be imagined. We adopt his facts, having some regard to the Veracity of them, as he quotes the names of those on whom he practised in the

## Of Nervous Disorders

right of large Cities, tho' at the same time they are very extraordinary, but his reasoning is ridiculous. His facts chiefly relate to Cold bathing, w<sup>ch</sup> I think may be very Efficacious in the Hysterical Disease when continued for some time. However we have difficulty to conceive how a Patient should be kept in a Cold bath for twenty hours together, yet such is his Practice, at least for several hours together. I have had no opportunity of confirming it by proper Experiments, but pointed it out to your attention & shall give you some opportunity of seeing the imitation of it. —

I shall next mention the various medicines that are commonly considered, as increasing the Tonic Power, & thereby diminishing the mobility of the System. We have frequently the same doubts w<sup>th</sup> regard to many of these as of Cold. The Tonic medicines to be first taken notice of are the various metallic matters; Those of the most Universal Use are the Chalybeates, w<sup>ch</sup> are of various forms, but little different I imagine in Power. They are of Uncertain Use in our present

293

subject, perhaps absolutely in the Hysterica  
Plethorica, or if they are to be admitted, it is at  
last in a small quantity at once & sparingly.

On the contrary they are absolutely necessary & per-  
haps the chief medicines when it depends on the  
Chlorotic State, under the general Flaccidity  
that attends it, or whenever the Constitution has  
a tendency that way. I would observe that Chaly-  
beats contrary to a general rule I have formerly  
delivered here, of giving them in small doses, & by  
degrees, that they should be employed in larger  
doses than they are commonly given in, as I have  
found from many Experiments in Hysterical affec-  
tions, a <sup>th</sup> more remarkable Success than otherwise.

In favour of my former Opinion that Chalybeate  
were given w<sup>th</sup> more safety & Success in small doses  
& at longer intervals, I mentioned that the Suc-  
cess of Chalybeate Waters was greater perhaps than  
in any other form; but I now observe that mineral  
Waters have a Complicated Operation, that they very  
often act chiefly by their heat or Cold, & that by  
either Power they may be employed to determine  
to the Surface of the body by their action on the  
Stomach, or reaching the Surface by their bulk

Fluidity they encrease the Various Secretions, in both ways restoring the proper balance & tension of the system; & therefore the action of these Waters is not to be confounded w<sup>th</sup> the general effect of Chalybeate — The other metallic Tonics are perhaps very various. This Power is lodged in a great variety of metallic substances, but are hardly taken notice of except in Tin, Lead, & Copper. — as to Tin, its Preparations have been formerly & particularly among the Chemists celebrated for their Efficacy both in Hysteria & Epileptic Cases. But I have never seen them employed in any form, that could act as a Tonic in this Country, & therefore dare not speak of them —

We are well acquainted w<sup>th</sup> the Power of the Preparations of Lead as Astringent & Tonic, & so far diminishing the mobility of the system as to have got the appellation of narcotics. We know their use in Hemorrhagic Cases & lately in Febrile Diseases, but not in the Hysterica or Epilepsy tho' I think it deserves to be enquired into.

The 3<sup>d</sup> metallic is Copper, w<sup>ch</sup> is of much more frequent Practice, tho' attended w<sup>th</sup> more difficulty

## Of Nervous Disorders

being in very small doses powerfully stimulant particularly to the Stomach, & therefore to throw in a quantity so as to obtain its proper Tonic Powers. Van Swieten gives us on this Subject a curious fact, that he has seen a preparation of Copper, <sup>or</sup> which had no Stimulating Power, but merely after being swallowed diffused a sort of thrilling sensation over the whole system <sup>or</sup> which was remarkably useful in Epileptic Cases. Such a Preparation is much to be desired; he knew not the Composition, nor have we yet found it out, but aim at it in this manner, all the metalline Substances are only active when combined <sup>with</sup> Saline Bodies; the simple acid & alkaline Salts render them more active than the neutrals, & therefore I have learned from Germany to employ a Neutral Salt, an Ammoniacal Salt <sup>or</sup> which does it more properly. I have tried it <sup>with</sup> very various success, but frequently <sup>with</sup> so much advantage me repeat the Trials, & hope to ascertain its use more exactly. I shall have occasion to speak of its use afterwards on the Patients on whom I shall employ it. —

## Of Nervous Disorders

The other Tonic medicines after the metal-  
 lies are various Vegetables. 1<sup>st</sup> The Simple as-  
 tringents. Whether these act by increasing the Con-  
 traction of the Solid Fibres, & thereby giving a  
 greater tension, or by diminishing the mobility  
 of the System cannot be determined: probably in  
 both ways, It is certain however that astrin-  
 gents have been formerly much employed in taking  
 off the mobility of the System in the Disease we  
 are speaking of. The Viscus Quernus or misel-  
 toe has been the most celebrated, w<sup>th</sup> tho' it seems  
 to have been introduced w<sup>th</sup> a great deal of Super-  
 stition, we cannot refuse the facts given concerning  
 it. I believe it usefull more particularly in Epilep-  
 sis; in Hysteric Cases I cannot say I know its Use,  
 except as I shall observe the two Diseases are so  
 frequently combined. With regard to it & others such  
 like, I imagine we know not their Use, nor are  
 we in the way of learning it, as they require a lon-  
 ger time than we have patience for, & certainly  
 in larger Doses than we employ them. - The  
 next astringents I would mention are the Bit-  
 ters constantly supposed to be Tonic & Strengthening

## Of Nervous Disorders

medicines, & certainly more immediately active than the former, as they act directly on the Stomach. Their Effects however are not propagated thence to the rest of the System unless when used in larger quantities than common; but where the Disease depends chiefly on the weakness of the tone of that single organ, where the Stomach is the Part chiefly complained of, they are undoubtedly of considerable use. They are not very useful in the proper Hysterica, but in the various Symptoms of Hypochondriasis so often connected w<sup>th</sup> the hysterical Disease, they are of very evident & considerable service. — Instead of using astringents or Bitters singly, we have of late learned to prefer the Combination of both; the Peruvian Bark is a medicine of this kind, w<sup>ch</sup> has supplanted the other two Classes.

The use of this gives a strong Presumption of its Tonic Power: at least I think no satisfactory Explanation of its action has yet been offered, & if we do not allow this, we must again talk of it as a Specific. — From its obviating the Spasmodic affections in Fevers, analogy has led us to employ it in Epileptic & Hysterical Cases, yet it

302

## Of Nervous Disorders

is there much less certain & I may say, disappoints us every day. I would alledge that the reason of this is, that from our Practice in Trevers, we conclude nothing can be expected from it unless when given in large Doses, & still very little unless these doses are given immediately before the Fits come on. But our ordinary Practice w<sup>th</sup> Peruvian Bark in Hysteric & Epileptic Cases is neither managed in one way nor another; In the last because it is difficult to judge of the approach of Fits, except in the Epileptic, where they are sometimes nearly Periodical, so that we can throw in a suitable Quantity immediately before they return, & I have seldom found it usefull except in such Cases: exactly Periodical hysteric Fits are rarely to be met w<sup>th</sup>, & therefore can receive little Benefit from this Valuable medicine. —

Another Set of Tonic medicines are the Aromatics. These are certainly employed in present Spasms particularly of the Alimentary Canal to w<sup>ch</sup> they can be directly applied, but how far they are of any Use in obviating future Spasms or w<sup>ch</sup> occur at a distance from their Exhibition.

*[Faint, illegible handwriting in cursive script, likely a letter or manuscript page.]*

*[Faint, illegible handwriting visible on the right edge of the page, possibly from the adjacent page.]*

Of Nervous Disorders.

They approach to another Class of medicines to be mentioned for taking off the mobility of the system, viz. the Antispasmodics, a Class of medicines however very difficult to be spoke of.

They have this singularity that they very often unite a Stimulant & Sedative Virtue at the same time in the same Substance. This is in the first place a Theory difficult to understand, I would therefore throw out a short hint w<sup>th</sup> regard to it.

I imagine the operation of Medicines on the nerves are in two ways; one like that of the several mechanical Stimulants that act merely by changing the texture of the Part, & in consequence of that act on the Nervous Power; The other operation I imagine does not thus affect the texture of the Part but merely the nature of the Nervous Fluid itself. Now I imagine that all Stimulants are of the first kind, & in proof of that, the many medicines of the Stimulating kind, the Chemical Stimulants as they are called, do not act on every part of the System, but

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting visible on the edge of the adjacent page.]*

## Of Nervous Disorders

merely on the Extremities of Nerves modified in a particular manner so as to be exposed to the topical action. The Sedative Powers are without any sensible impulsion, & in short act more universally on every nerve, as well as that to w<sup>ch</sup> they are applied. Of this kind are the various Poisons, the Belladonna for instance w<sup>ch</sup> acts indeed topically by inflaming the Stomach & whole Tract of the Fauces over w<sup>ch</sup> it passes, but before it produces these Effects, it exerts various Powers on the Nervous System, that cannot at all be found connected w<sup>th</sup> that. — Having said so much on this head I return to observe that Antispasmodics having so often Stimulant & Sedative Virtues united, it becomes difficult to say in Hysterie Cases what depends on one quality, & what on another in taking off the present Spasms; the Stimulant Virtue may have some Effect, but even there the Sedative seems more considerable, & certainly has the greatest Share in obviating the future Spasms. I could make many remarks on the different kind of Antispasmodic remedies but shall

Of Nervous Disorders

confine myself to the two most Powerful, w<sup>ch</sup>  
as Sedatives are Camphor & musk. With regard  
to both, these Powers are only evident when they  
are given in large doses. That is the reason why  
we seldom practise w<sup>th</sup> them, because their Sana-  
tive Powers are nearly connected w<sup>th</sup> their Deleter-  
ious. You may give Camphor to 10, 20, or 30  
grains without any sensible Effect; in many  
Cases I have given it several days together to  
the quantity of 3℥ w<sup>th</sup> no sensible Effect, but  
when it was increased to 3℥ w<sup>ch</sup> was only  $\frac{1}{4}$  more,  
it produced Syncope & other dreadful Symptoms,  
that rendered the Patients Life doubtful, & from w<sup>ch</sup>  
he recovered in some hours w<sup>th</sup> difficulty. There  
are several other Experi<sup>ts</sup> made on it to the same  
purpose shewing that it seldom discovers its Virtues  
to any degree till it threatens danger. That to me  
is the Cause of great diffidence in the Employ-  
ment of Camphor & I believe from this timidity  
I have altogether misjudged of its Effects. As to  
musk I have not had the occasion to see the  
danger of it so immediately connected w<sup>th</sup> high

*[Faint, illegible handwriting covering the page]*

*[Faint, illegible handwriting on the right edge of the page]*

## Of Nervous Disorders

Doses, & I imagine it might be a much more beneficial medicine if it was not for the Unlucky Circumstance that nothing is more rare & Uncommon than pure Musk & consequently very dear, so that when we go to high Doses we are forced to lay it by on account of Expence; hence we do not yet know the proper Use or Extent of it. — There is another Particular to be observed <sup>th</sup> regard to all Anti-spasmodics, that they are only of great Use or Power when given in the time or near the Approach of the Fits, as their Effects are not permanent. Another known reason for the same thing is, that their operation <sup>th</sup> we desire is not only thus short in ~~th~~ Duration, & passes before the necessity for it, but after their first operation as Sedatives, they leave behind Effects of hurtfull tendency to our purpose. This will be best explained upon the subject of the most Powerfull & best known Anti-spasmodic Opium whose Use in the disease we are speaking of, is yet much disputed. It is absolutely powerfull in taking off the present Spasms subsisting in the Body, whether Colic in the Ab-

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the right edge of the page, likely bleed-through from the reverse side.]*

## Of Nervous Disorders

mentary Canal, or Tetanus in the muscular system. It is, I say, the only certain remedy in present Spasms; Whether it is usefull in preventing Chronic Paroxysms when attended w<sup>th</sup> moveable Spasms in the Alimentary Canal as in the Hysteria Disease, or w<sup>th</sup> various Agitations of the muscles as in Convulsive Cases is by no means certain; for the same reason as was before mentioned, of the difficulty of giving medicines before the approach of Fits, because of their Irregularity. — We have seldom opportunity of discerning w<sup>th</sup> Certainty that Opium given immediately before the attacks might be very usefull as I have great reason to suspect; but given at a distance from them, it is undoubtedly hurtfull, & however this is to be explained, Physicians agree that the frequent Use of Opium in Epileptic Cases & in what I call the proper Hysteria is very certainly & generally hurtfull. — The famous opposers of the Use of Anodynes in Inflammatory Diseases impute the rarefaction of the blood to Opium. This I imagine can only be accounted for by the Relaxation it induces on

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the right edge of the page, likely bleed-through from the reverse side.]*

## of Nervous Disorders

the moving fibres of the system, taking off the Constriction of the Vessels, under w<sup>h</sup> Circumstance we know that the Blood dilates, & is rarefied. It is not therefore the Power of Opium as acting on the Blood, but giving an opportunity to that rarefaction by its action of relaxing the Vessels.— But from the Principles we have before given, we may perceive that this is actually inducing the Plethoric State over the whole System; taking off the Constriction of the Solids is the principal foundation of the mobility of the System; & thence we easily explain why Opium has that Power as a Sedative, of taking off the present Spasms; but when that Operation is over, leaves the Body in a much more irritable State, & therefore is so justly blamed for increasing & aggravating Fever & other inflammatory Diseases. This is enough to give you some foundation for the application of Opium in the Disease we are speaking of.— I have only to add that among Tonics, & among those last mentioned Medicines Antispasmodics we should never forget that Exercise is the chief,

whether we consider it as by degrees strengthening the solid System, or supporting the force of the Circulation by determining in a particular manner to the Extremities of the Vessels; in both those respects I think it a usefull remedy, but is of difficult use in the Case of great Debility in Hysterie cases. There is in such a surprising Delicacy <sup>th</sup> regard to any motion in the least degree unusual, of w<sup>ch</sup> I have had an instance within these few days of a Lady in that Situation, in whom a little Laughing brought on a Deliquium Animi & some degree of hysterie Paroxysm, & a little Uneasiness of Posture had the same Effects. And accordingly I have not found any People of more difficult management <sup>th</sup> regard to Exercise than the Proper Hysterie; & therefore in this Case, if the Exercise is not extremely smooth & moderate, & <sup>th</sup> these Conditions likewise rendered Permanent & Durable, it can hardly be of considerable Effect. you will see thence that the

## Of Nervous Disorders

Exercise of gestation w<sup>ch</sup> is smooth, if undisturbed Permanent, will be the most Effectual; & I can say that in Case of mobility of the System, Sailing is the Exercise of all others of the most considerable Effect & has produced several notable Cures. — This finishes what I proposed on the general Cure of the Hysterical Disease; how these general rules w<sup>ch</sup> I have now adapted to the Plethoric species are to be varied w<sup>th</sup> respect to the particular Causes mentioned as Venery Sterility &c or adapted to the Chlorotic State or Cases of Inanition your Discretion will readily suggest. —

I now proceed to the general Cure of the Hypochondriasis depending on an opposite State of the System, a Defect of mobility or Torpor. It may be necessary first to observe that there are perhaps two principal genera of Hypochondriasis; the one in w<sup>ch</sup> the exquisite melancholic Temperament occurs, & the other when that is not present but the affection of the Crurae Viscerum arises from various Causes habitually weakening the Tonic

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the right edge of the page, likely bleed-through from the reverse side.]*

## Of Nervous Disorders

the System & these part in particular - I shall speak first of the management of the proper Melancholic, & afterwards hint what arises from the Consideration of the Various Species. As to that arising from the melancholic temperament I alleged it was a disease of Cold Climates & Seasons, while the Hysterie belonged to the Warm, & therefore the principal remedy in the melancholic Hypochondriasis is warm Seasons & Climates; but this is attended w<sup>th</sup> great Difficulty. In proof of the general assertion of the Effect of Cold Seasons I would put you in mind of the Beginning of a noted French Romance, "In the gloomy Month of November when the good People of England hang & drown themselves, a Disconsolate Lover walked out in the Fields".

It is certainly true that the Winter Season produces the highest Degree of Melancholia; but this is at the same time to be allowed that there are ten times the number of atrabiliarians in Spain than there are in Britain. - I do not have said that the Hysterie Disease ap-

## Of Nervous Disorders

years much more considerable in the warm  
 climates, yet the Sanguineous Constitution  
 is to be met <sup>with</sup> in all the Northern climates.  
 It is ten times more frequent in Spain & Den-  
 mark than in Austria or the Southern parts  
 of Germany. We are likewise certainly inform-  
 ed that the Northern Inhabitants of Europe  
 were formerly of Smooth & Rosy Complexions  
 Blue Eyes & Fair hair; such were the Gauls  
 & Britons; but now the Constitution of the  
 South has encroached upon us; they are of a  
 more Dry & rigid body, black hair & Pallid  
 Complexion, & the melancholic temperament  
 is much more frequent & therefore what I  
 have said of the Warm & Cold Seasons require  
 some limitation. It is the moderate warmth  
 of our Summers, & the temperature of the Win-  
 ters in the Southern Parts of Italy that are pro-  
 per in this Disease. The Extream heats being  
 as unfavourable to the Disease as great Cold;  
 & therefore when I prescribe in this Case, I  
 generally advise to spend the Winter in France

or the South of Germany, but the Summer in Britain. For the Warm air may seem to be usefull here, yet a moderate cool air is a necessary Stimulus to our System — After Climate, Exercise is next to be observed, & should be constantly persisted in; but that Perseverance is difficult in Bodily Labour, & therefore the Exercise of Equestrianism is commonly thought of. But the Disease is not nearly so much benefited by these smooth & uniform exertations <sup>wh</sup> are more adapted to hysterical Cases, as those <sup>wh</sup> give occasion to Bodily Exercises, & therefore Riding <sup>wh</sup> indeed is more universally usefull in every species of the Disease is particularly serviceable here. Another curious reason for the necessity of riding is, that it engages a Person to consider his own way. Nothing is more usefull than to interrupt the Train of their Thoughts <sup>wh</sup> commonly turn on their own ailments, or some particular Objects to <sup>wh</sup> they are attached, & therefore aggravate their Disease. And I have known an instance

of a Person riding in a machine without receiving any benefit, but on being put into a single Horse Chair, w<sup>ch</sup> required his attention to conduct himself, he quickly found relief.—

These are the two remedies I mentioned as such, w<sup>ch</sup> cure the Torpor, the proper foundation of this Disease. Other species of the same remedies are intended to interrupt their attention to particular objects, w<sup>ch</sup> is done by presenting to them a constant succession of various objects, w<sup>ch</sup> Variety is only to be had by pursuing some length of Journey rather than beating the same tract of w<sup>ch</sup> we have instances; Persons riding over the same field without any benefit, w<sup>ch</sup> they afterwards found in a long Journey. I mentioned just now the operation of mineral Waters, but I would just observe that Chalybeates in the genuine Melancholic Hypochondriasis are hardly ever admissible, & I think I have seen bad Effects from them, but not so in mineral Waters. They are very often usefull in consequence of their other Powers w<sup>ch</sup> I mentioned either as

Determining to the surface by acting on the Stomach or expelling the Secretions. But to a view to Hypochondriacs, we have so constant a disposition to acrimony in the Stomach, that mineral Waters somewhat alkaline are of remarkable Service, such as the Seltzer & Caroline Waters in Germany, & on this is founded the Use of Soluble Tartar <sup>or</sup> from Experiments has been lately recommended in the Cure of the ~~Hyp~~ Melancholic Hypochondriasis & Maniacal Cases either as being absorbent or laxative, & in either way obviating the Principal Circumstance attending this Complaint. —

Another remedy applicable to the Hypochondriasis & very often incompatible w<sup>th</sup> the Hysterical Disease is Warm bathing. Any Warm Baths either w<sup>th</sup> or without the impregnation of the Substances commonly used, by warming the Surface of the body, & keeping up the Determination of the Nervous Power to it, & by taking off their rigidity as it is likely they should, are very often found a principal remedy in the Hypochondriasis. But as this Disease appears by its Symptoms

chiefly to affect the *Prima Via*, so a particular attention is due to the state of these organs. Here we can more certainly & exactly regulate the diet by choosing Solid & avoiding Aescent food, & likewise Drink that is capable of producing the Aescent Fermentation; in both we should have in view to support the tension of & give a proper stimulus to the *Prima Via*. We should also endeavour to obviate the Costiveness that is the consequence of the general temperament producing this Disease, but proves at last a Cause & aggravation of it. To this there is but one remedy certainly usefull, viz. the Aloetic Purgatives, perhaps from their peculiar quality of stimulating moderately without leaving an Astringency. When a Stronger Stimulus is required Mercury may be joined. Upon the whole, if Exercise is rightly employed, the Diet properly regulated, & Costiveness avoided, we do almost all that is commonly necessary in Hypochondriac Cases. Some Purgatives joined w<sup>th</sup> mineral Waters are equally well adapted to these Diseases. The last medicines are the Various Bitters & Aromatics; The latter

proper to abate present Spasms, the other useful in restoring the Tone of the relaxed Stomach. But it should be observed that in most Hypochondriacs an abuse may be committed w<sup>th</sup> these in prescribing them too commonly & constantly. The Use of Bitters & Aromatics w<sup>ch</sup> at first stimulate & strengthen the Tone of the Stomach, do at last weaken & wear it out entirely & bring on these Consequences of long subsisting Hypochondriac ailment, the Cachectic State, Leucophlegmatia & Dropsy &c. somewhat similar may be said of antispasmodics w<sup>ch</sup> take off present Spasms, & might frequently be of Use, but there is seldom occasion for them, or rejecting the various fated medicines they might be confined to Opium. In using w<sup>ch</sup> however we must be careful of weakening the Tone, & inducing Costiveness so troublesome in these Cases.

We are now to speak a few words concerning the Cure of the Species of the Hypochondriac Disease w<sup>ch</sup> are considerably more diversified than those of the Hysteria.

The first Species & w<sup>ch</sup> we have kept in

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the right edge of the page, likely bleed-through from the reverse side.]*

## Of Nervous Disorders

view in speaking of the method of Cure is the *Exquisita* or that evidently depending on the melancholic temperament. The 2<sup>d</sup> is a *Pathemate*, a the next a *Studio Nimis*. With regard to both these, they commonly coincide in the first, i. e. they commonly happen in the same temperament, & therefore as to Cure may be considered as the same. They coincide in the first, because it is only in such melancholic temperaments that *Passions* have such Effects, or that intense application to Study of one kind, or to one object. It is true that both Species may arise on other occasions from the Extreme Severity of grief, or from a Series of Conditions that serve to occasion grief. or the *Hypochond. Disease* may arise from Excess of Study, or from various Circumstances independent of Temperament; but where this Diversity occurs it is not possible to lay down any general rules, but must be left to the Discretion of the Physician in one Case acting the Part of

Of Nervous Disorders

a moralist or Divine, & in the other employing his Prudence in inducing the kind of Study that may be necessary. —

The 4<sup>th</sup> a Venere Nimia. This & almost all the following differ from the three former in that they are not connected w<sup>th</sup> the Melancholic temperament; nay this fourth Species happens more frequently in the temperament w<sup>ch</sup> is the foundation of the Hysteria Disease.

The Use of Cold Bathing constantly employed is the only powerfull remedy I have found in this Species. —

The next Species I mentioned was the Hysterica s<sup>ca</sup>, I said, gives a Combination of the two Diseases together, intermixed in various Degrees. Here the use of Cold bathing & some medicines w<sup>ch</sup> I suspect rarely Admissible in the pure Melancholic are on the contrary the principal remedies; i. e. We should keep in View the Mobility w<sup>ch</sup> first gave occasion to the Disease rather than the particular Symptoms w<sup>ch</sup> might now incline us to con-

sider it as Hypochondriacal. —

next to these I think was the "Arthritica"  
 which appears in various forms, & is attempted to  
 be remedied by all the different means employed  
 in one or other genus. But I am disposed from  
 the latest Observations & Experiments to say  
 that the safest & most Effectual remedy for ob-  
 viating & carrying off the various affections of  
 the alimentary Canal that depend on gout  
 is the Use of Chalybeates; We commonly attempt  
 the Cure of these affections by Vegetable tonic  
 Bitters & particularly the Bark; & in regard to  
 which I would observe, that we know now that  
 the long continued Use of Bitters will cure the  
 gout, & will prevent these inflammatory Pa-  
 roxysms in the Extremities in which it chiefly con-  
 sists, but at the same time we have learnt that  
 this manner of curing seldom fails to bring on  
 the Hypochond: Arthritica or various Disor-  
 ders of the alimentary Canal & sometimes in  
 other Parts of the System. When the Disease  
 only appears in the alimentary Canal I think

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the right edge of the page, likely bleed-through from the reverse side.]*

## Of Nervous Disorders

it improbable that it should be safely cured by these remedies that will prevent the gout from seizing the Extremities, but may bring it into the Alimentary Canal: On this account it is certain that the Use of Bitters to a considerable Degree is hurtful to arthritic Patients in every Condition. not but the Use of Bitters in a gouty Paroxysm, may obviate these Symptoms; but I alledge that they will undoubtedly by repetition wear out the tone of the stomach, & so far as they throw the gout out of the Extremities upon the Alimentary Canal, & therefore may produce Chronic & fatal Diseases of <sup>the</sup> Instances are not wanting.

Connected to the Hypochond. arthritica is the nephritica. We know in general that the Use of astringents as the Uva Ursi & others, are of particular use, as also the absorbent Earths, particularly Lime Water in nephritic Diseases; probably they may be of principal Service in the affections of the Alimentary Canal depending on nephritic affections. Here another Proof of the

## Of Nervous Disorders

Connection between arthritic & nephritic affections, that we find at least that the Lixivious Waters are of considerable use in the Gout, & I believe may be marked out as another safe remedy for affections of the Alimentary Tube, depending on gout. — Considering in what manner the Arthritic Hypochondriac Symptoms appear & in what Constitutions, viz. those that are most moveable, it may be a question how far Cold Bathing is adapted to them? The question arises from this Consideration that the proper Course of Gout is in an inflammatory affection of the Extremities, & we find Cold applied to the feet to prevent this is attended w<sup>th</sup> the worst of Consequences. Whether the Constant Use of Cold Bathing may be of such Effect is probably at least a question. I have actually known Cold Bathing attended w<sup>th</sup> bad Consequences in gouty Persons, but at the same time I must acknowledge that in many instances of Arthritis, no doubt, Cold Bathing has been practised w<sup>th</sup> Advantage. It will require Discernment to say in w<sup>ch</sup> of the two

Does it will, or will not be proper; I have not found out a Solution to this question, but offer it as one that deserves to be solved. —

as to the other Species, "Ab Inanitione", "Emphrastica", & "A Suppreſſis Evacuacionibus"; all these admit of no remarks here, because they are particular Diseases, & may be considered as the chief Cause, w<sup>ch</sup> when removed the Hypochondriac Symptoms cease of Cause. —

There are two other Species to be mentioned, "A Repulsis" from Spontaneous or Artificial Eruptions or Ulcers on the Surface repelled or dried up. The Cure of this is a matter of difficult Practice. We commonly attempt it by endeavouring to raise some Evacuations near the Part affected, as by Issues or Setons; but this is often without effect. I see some instances in Sauvage w<sup>ch</sup> if we could imitate w<sup>th</sup> Success would probably be more Effectual, viz, removing the Disease, when it was of a Contagious nature, as the Itch, by Inoculation, or getting a Person, who had the Disease, from whom the Patient might take a

Cure

new Infection; he tells us he made a perfect in this manner. I mention this fact as curious, tho' I cannot suggest the proper manner of conducting the Process. —

And lastly the Hypochond; Ailments "A Fe-  
bre Interrupta". These I have more than once  
met w<sup>th</sup> & may observe they are of difficult manage-  
ment. They have however been cured upon the ge-  
neral Plan of Hypochondriacal Symptoms by  
constant & habitual Exercise, & those remedies  
w<sup>ch</sup> restore the Determination of the System w<sup>ch</sup>  
had been changed, sometimes to the Surface, by  
Rudrifics, as Dover's Powder; & I have met w<sup>th</sup>  
two Cases where I could still discern, tho' ob-  
scurely, marks of a Periodical Fever; whenever  
that is the Case, I would still as before interrupt  
it by the Use of the Barb, the only certain reme-  
dy we know of for obviating that tendency  
to Periodical returns. There are probably other  
methods of managing it, w<sup>ch</sup> the Ancients seem  
to have been acquainted w<sup>th</sup>, tho' we are not.

*[Faint, illegible handwriting in cursive script, likely a letter or manuscript page.]*

Of Nervous Disorders

Celsus in Now & Lingering Fevers advises  
the exciting the various formal Paroxysms of  
them, to bring on a Storm & all the Symptoms  
that belong to these. He mentions Uction, Baths,  
& Friction for this purpose, w<sup>ch</sup> I have not  
known imitated. —

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

## Cutaneous Eruptions

The first Case we shall treat of is that of *malig*  
*millar* - Her Symptoms commonly come on w<sup>th</sup>  
 some degree of Swelling, Inflammation, & Pain  
 (w<sup>ch</sup> however are often very inconsiderable) in the Part.  
 after that appear small white Pustules, w<sup>ch</sup> en-  
 large, pour out a Purulent matter, w<sup>ch</sup> forms  
 Crusts over the Part - sometimes new Pimples  
 arise under this Crust sometimes without any  
 new Pimples, there continues a constant oozing  
 of a fatty Uctuous matter - Before the Erup-  
 tion there is an anxiety, oppression, & some degree  
 of Fever, w<sup>ch</sup> are also reproduced by a Retrac-  
 tion of the Evacuation. but these Symptoms go  
 off as soon as the Discharge from the affected Part  
 returns - This Eruption appears generally in the  
 Spring, & goes off when the Warm Weather comes on.  
 It attacks chiefly Sanguine habits & those w<sup>th</sup>  
 smooth Shins. When it seizes Children, there  
 are commonly of the Scrophulous or Rachitic  
 disposition, the last is evident from their large  
 prominent foreheads - It attacks generally

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting visible on the edge of the adjacent page.]*

## Of Cutaneous Eruptions

the Upper Parts, as the hairy Scalp, Ears, Arms &c more than the lower Extremities, tho' sometimes the whole body is affected. - It occurs for the most part in Infancy, tho' this rule is not commonly general; I have known People of 40 years of age labouring under it. - When it is cured, it leaves no Cicatrix, only the Cuticle is thicker & remains scaly for some time afterwards. -

It appears to be the Disease of the Skin, termed by the Greeks *achron*, & by the Latins *Præputium*. Sauvage puts it under the genus of *Tinea*, & Clap of *Lachexia*; but this Clap is very imperfect, as it is difficultly distinguished from the *Affectus Superficialis*. - The *Tinea* appears evidently to be an affection of the Bulbs of the hair, <sup>tho'</sup> the *Tinea* <sup>tho'</sup> we are now treating has no connection. Two of the Species of this genus are the same disease, viz. the *Tinea Lactea*, & *Volatica*, the Diagnostics of each being very precarious. The *Tinea Lactea*, while Suckling, & the *Volatica* during Dentition; This last appears often without having any connection <sup>tho'</sup> with Dentition. This Disease is

+ This also spreads faster & leaves deeper ulcerations than the others. -

## of Cutaneous Eruptions

Distinguished from the Herpes <sup>or</sup> has a thinner & more Ichorous matter; from the Herpes Cruentus by the greater degree of Acrimony in this last; It differs from the Scabies as this seizes generally the joints & is more Itchy. —

Tho' this is a disease of the Surface, it however seems to be connected to the general System; as this is affected before the Eruption appears, the Anxiety, nausea, Fever &c, <sup>or</sup> go off in proportion as the Eruption advances. These Symptoms also follow a repulsion of the Eruption Hence Authors have believed that a particular Acrimony existing in the fluids, & being deposited on different places, gave rise to the abovementioned Symptoms. Let us therefore consider how far Acrimony in the fluids may be the Cause of this Disease. The common Proofs of Acrimony being present are not Conclusive, for tho' it appears on the Skin yet this by no means proves that it existed in the System in general. This is evident if we consider the generation of Pus after Wounds or Inflammations

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the right edge of the page, likely bleed-through from the adjacent page.]*

## Of Cutaneous Eruptions

It always takes place in the sound or morbid body. The Production of this Liquor depends on a peculiar Conformation of the Parts, the Consequence of an Inflammation, & the Degree of Consistence & quality of this Pus is entirely owing to the different Constitution of the inflamed Part. Ulcers of the Legs are often very difficult to cure, notwithstanding a number of internal remedies have been exhibited for this purpose, in order to change the fluids as was supposed, especially while the member is kept in a depending Situation; but no sooner is the Leg placed in a horizontal Posture, the Ulcer soon changes its appearance & heals up with great facility. Here then we see an acid fluid thrown out on the Surface which depends on the peculiar State of the affected Parts, without the least Supposition of its Preexistence in the mass of fluids. — When we examine the Changes of the Secretions, we shall find these more owing to the particular State of the Secretory organ, than to any taint of the fluids in general.

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting visible on the right edge of the page, likely bleed-through from the adjacent page.]*

## Of Cutaneous Eruptions

Vomits w<sup>h</sup> operate very strongly produce an increased Secretion of greenish bile of a very Acid nature, tho' before the Exhibition of the Vomit the System was in a perfectly healthy State - a Blow on the Head will produce a Vomiting & an increased Secretion of Puraceous Bile. In Catarrhal Cases what different Changes are induced on the Mucus both in Consistence & Colour by the different States of the Secreting Vessels. The Changes of Colour in the gonorrhoeal Discharge is owing chiefly to the Acrimony of the Stimulus irritating the mucous Ducts & not to any greater Virulency in the Discharge - Pimples in the face are often the Consequence of drinking Water; these however go off if the Patient drinks Small Beer or Wine. In these Cases there is no reason to suppose that any Acrimony exists - In the Tinea where a humor exudes from the whole hairy Scalp & forming crusts, Mercurial, Antimonial & other medicines are not of the least Service; Eradicating however the Bulbs of the Hair proves

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting on the right edge of the page, likely bleed-through from the reverse side.]*

## Of Cutaneous Eruptions

a radical cure; w<sup>ch</sup> shews that the disease depends upon a topical affection of the roots of the Hair & not on any general acrimony.

If the humour does not continue to be discharged, but is repelled, various disorders arise in the system. But this is no proof that any acrimony existed in the general mass of Fluids. all the same Disorders arise from a suppression of the menstrual Flux, yet no body will venture to say that any thing acid is thrown off by this Evacuation. — When the Discharge of mucus from the nose in consequence of taking Snuff is by any means obstructed, various Rheumatic affections of the head, Toothach, Vertigo, & sometimes Confusion of the Senses have sometimes been the Consequence; yet surely no acrimony can be alledged in this Case — all the above mentioned Symptoms may be accounted for from the changed Ballance of the Circulation. and the Absorption can only be considered as a Colla-

## of Cutaneous Eruptions

tural Effect without in any way acting as a Cause. But there also is something else in the Determination besides the quantity w<sup>ch</sup> is necessary to produce these Effects; since we see a greater quantity of Fluids sent to particular Parts without any topical Eruption appearing. Here however there is no occasion to suppose a peculiar Acrimony exists in the fluids. I have seen several instances of nausea, sickness, Oppression & followed by an Eruption of red spots on the Skin, produced by a small quantity of Lobster taken into the Stomach, w<sup>ch</sup> continued as long as this Substance remained in the Stomach; but if it was thrown up by Vomiting, the above Symptoms disappeared. The same Phenomena have arisen from Crabs Eyes taken into the Stomach.

Here then there is no reason to imagine that acrimony existed, as the Effects were produced before we could possibly have conceived that these Substances reached the Sanguiferous System,

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

## Cutaneous Eruptions

& must therefore have produced their Effects by inducing a topical affection on the Surface— Hence in the many instances recited above we have no reason to believe that an Acrimony was present in the fluids w<sup>ch</sup> being deposited on particular Parts was the Cause of the Eruptions—

General maxims are however very hurtful in Physick, & it would be as absurd to deny that Acrimony exists in no Case, as to say that it is the Cause of every affection. — We before said that Ulcers in the Legs resisted the Powers of the most Efficacious remedies while the Leg was in a depending Situation; but when laid horizontally, it often heals without the aid of any remedy. There are some Ulcers as in Scorbatic habits, w<sup>ch</sup> evidently depend on the diseased state of the fluids, & w<sup>ch</sup> are only to be cured by medicines given internally. — In the Syphilis or Lues Venerea there is evidently an Acrimony received into the System w<sup>ch</sup> is the Cause of that Disease; and in the Scrophula there is

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

*[Faint, illegible handwriting visible on the right edge of the page, likely from the adjacent page.]*

## Of Cutaneous Eruptions

probably a peculiar acrimony, tho' this does not exert its Effects unless under certain Circumstances. The Leprosy is undoubtedly owing to a peculiar acrimony; as are also all Contagious Diseases, <sup>or</sup> not only affect the nervous system, but also partly assimilate the fluids to its own nature. Some Poisons have also this Effect as the Rabies Canina. Several Diseases are owing to the absorption of an acrimony formed by a topical affection. As the Ectric from the Absorption of Purulent matter; & in Cancers <sup>or</sup> arise merely from a bruis, when Ulcerated, there is a quantity of that acid fluid received into the Blood <sup>or</sup> soon infects the whole system, & produces Cancers in other Parts of the Body. Hence acrimony often also exists in the system, & is the Cause of several Diseases. —

The Nature of this acrimony however does not much assist us in curing the Diseases of <sup>or</sup> it is productive, as we are entirely ignorant of its qualities, what do we know concerning the Nature of that peculiar acrimony <sup>or</sup> is the Cause

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

## Of Cutaneous Eruptions

of the Scoury or Lues Venerea? — In these diseases mercurials, Antimonials, & mineral Waters do not act so much by evacuating the morbid acrimony, as by keeping up the natural Secretions, & a healthy Determination of the Blood.

In the Cure of the Small Pox we only promote the Evacuations, w<sup>ch</sup> nature makes use of to throw off the offending acrimony, or obviate the Effects of this upon the nervous system till that become accustomed to it — Hence in those diseases w<sup>ch</sup> we know are owing to a peculiar acrimony, this however does not in the least direct us in our method of Cure since we are entirely unacquainted w<sup>th</sup> the nature of the offending matter. —

The Cause of our Patients disease seems to be a topical affection of the Part. Astruc & Sauvage think that the Sebaceous glands are the seat of the Disease. It does not seem to be seated deep below the skin otherwise the symptoms of Burn would be more violent. — This topical affection seems to depend on a peculiar Determina-

*[Faint, illegible handwriting, likely bleed-through from the reverse side of the page.]*

## Of Cutaneous Eruptions

nation of the fluids to the affected Part; When this Determination is turned on the Internal Parts, nausea, Vomiting, & the Symptoms of Fever are the Consequence — Pimples in the Face are often the Effect of such a determination when there is no reason to suppose any Acrimony exists. I know a Gentleman subject to such an Eruption on his face w<sup>ch</sup> is greatly varied by different things w<sup>ch</sup> he eats. They are greatly increased immediately after eating Fish, even before these Substances can be supposed to have entered the blood. They are removed by Fever & other Diseases w<sup>ch</sup> he has laboured under, but appear as soon as he is recovered. — These Eruptions generally go off in the Summer when the Perspiration is more abundant. — I have therefore attempted the Cure of our Patient by antimonials w<sup>ch</sup> keep up a free & equable Determination to the Skin. As these however by themselves are found often to be ineffectual, I have joined a mercurial not as a Laxative, but applied topically so as to reach the Blood & Secretories. —

Of Cutaneous Eruptions

When these Medicines operate considerably  
by Stool, their Effects in Cutaneous Diseases  
are generally less considerable. —
